FOREWORD

The Government of India has set an ambitious target of imparting skills one out of every four Indians, to help them secure jobs as part of the National Skills Development Policy. Industrial Training Institutes (ITIs) play a vital role in this process especially in terms of providing skilled manpower. Keeping this in mind, and for providing the current industry relevant skill training to Trainees, ITI syllabus has been recently updated with the help of comprising various stakeholder's viz. Industries, Entrepreneurs, Academicians and representatives from ITIs.

The National Instructional Media Institute (NIMI), Chennai, has now come up with instructional material to suit the revised curriculum for **Workshop Calculation & Science - Electrician - Power Distribution 1st Year NSQF (Revised 2022)** under CTS will help the trainees to get an international equivalency standard where their skill proficiency and competency will be duly recognized across the globe and this will also increase the scope of recognition of prior learning. NSQF trainees will also get the opportunities to promote life long learning and skill development. I have no doubt that with NSQF the trainers and trainees of ITIs, and all stakeholders will derive maximum benefits from these IMPs and that NIMI's effort will go a long way in improving the quality of Vocational training in the country.

The Executive Director & Staff of NIMI and members of Media Development Committee deserve appreciation for their contribution in bringing out this publication.

Jai Hind

New Delhi - 110 001

Ms. TRISHALJIT SETHI,
Additional Secretary / Director General (Training),
Ministry of Skill Development & Entrepreneurship,
Government of India.

PREFACE

The National Instructional Media Institute(NIMI) was set up at Chennai, by the Directorate General of Training, Ministry of skill Development and Entrepreneurship, Government of India, with the technical assistance from the Govt of the Federal Republic of Germany with the prime objective of developing and disseminating instructional Material for various trades as per prescribed syllabus and Craftsman Training Programme(CTS) under NSQF levels.

The Instructional materials are developed and produced in the form of Instructional Media Packages (IMPs), consisting of Trade Theory, Trade Practical, Test and Assignment Book, Instructor Guide. The above material will enable to achieve overall improvement in the standard of training in ITIs.

A national multi-skill programme called SKILL INDIA, was launched by the Government of India, through a Gazette Notification from the Ministry of Finance (Dept of Economic Affairs), Govt of India, dated 27th December 2013, with a view to create opportunities, space and scope for the development of talents of Indian Youth, and to develop those sectors under Skill Development.

The emphasis is to skill the Youth in such a manner to enable them to get employment and also improve Entrepreneurship by providing training, support and guidance for all occupation that were of traditional types. The training programme would be in the lines of International level, so that youths of our Country can get employed within the Country or Overseas employment. The **National Skill Qualification Framework (NSQF)**, anchored at the National Skill Development Agency(NSDA), is a Nationally Integrated Education and competency-based framework, to organize all qualifications according to a series of **levels of Knowledge, Skill and Aptitude**. Under NSQF the learner can acquire the Certification for Competency needed at any level through formal, non-formal or informal learning.

The **Workshop Calculation & Science - Electrician - Power Distribution 1st Year NSQF (Revised 2022)** under CTS is one of the book developed by the core group members as per the NSQF syllabus.

The **Workshop Calculation & Science - Electrician - Power Distribution 1st Year NSQF (Revised 2022)** under CTS as per NSQF is the outcome of the collective efforts of experts from Field Institutes of DGT, Champion ITI's for each of the Sectors, and also Media Development Committee (**MDC**) members and Staff of **NIMI**. NIMI wishes that the above material will fulfill to satisfy the long needs of the trainees and instructors and shall help the trainees for their Employability in Vocational Training.

NIMI would like to take this opportunity to convey sincere thanks to all the Members and Media Development Committee (MDC) members.

Chennai - 600 032

EXECUTIVE DIRECTOR

ACKNOWLEDGEMENT

The National Instructional Media Institute (NIMI) sincerely acknowledge with thanks the co-operation and contribution of the following Media Developers to bring this IMP for the course **Workshop Calculation & Science - Electrician - Power Distribution 1st Year** as per NSQF Revised 2022.

MEDIA DEVELOPMENT COMMITTEE MEMBERS

Shri. M. Sangara pandian	-	Training Officer (Retd.) CTI, Govt. of India, Guindy, Chennai - 32.
Shri. G. Sathiamoorthy	-	Jr. Training Officer - SG (Retd.) Govt I.T.I, Trichy, DET - Tamilnadu.

NIMI CO-ORDINATORS

Shri. Nirmalya Nath	-	Deputy General Manager, NIMI, Chennai - 32.
Shri. G. Michael Johny	-	Manager, NIMI, Chennai - 32.

NIMI records its appreciation of the **Data Entry, CAD, DTP Operators** for their excellent and devoted services in the process of development of this IMP.

NIMI also acknowledges with thanks, the efforts rendered by all other staff who have contributed for the development of this book.

INTRODUCTION

The material has been divided into independent learning units, each consisting of a summary of the topic and an assignment part. The summary explains in a clear and easily understandable fashion the essence of the mathematical and scientific principles. This must not be treated as a replacement for the instructor's explanatory information to be imparted to the trainees in the classroom, which certainly will be more elaborate. The book should enable the trainees in grasping the essentials from the elaboration made by the instructor and will help them to solve independently the assignments of the respective chapters. It will also help them to solve the various problems, they may come across on the shop floor while doing their practical exercises.

The assignments are presented through 'Graphics' to ensure communications amongst the trainees. It also assists the trainees to determine the right approach to solve the problems. The required relevant data to solve the problems are provided adjacent to the graphics either by means of symbols or by means of words. The description of the symbols indicated in the problems has its reference in the relevant summaries.

At the end of the exercise wherever necessary assignments, problems are included for further practice.

Time allotment:

Duration of 1st Year : 40 Hrs

Time allotment for each title of exercises has been given below. **Workshop Calculation & Science - Electrician - Power Distribution 1st Year NSQF Revised Syllabus 2022.**

S.No	Title	Exercise No.	Time in Hrs
1	Unit, Fractions	1.1.01 - 1.1.07	4
2	Square root, Ratio and Proportions, Percentage	1.2.08 - 1.2.14	6
3	Material Science	1.3.15 & 1.3.16	4
4	Mass, Weight, Volume and Density	1.4.17 & 1.4.18	4
5	Speed and Velocity, Work, Power and Energy	1.5.19 & 1.5.20	5
6	Heat & Temperature and Pressure	1.6.21 - 1.6.23	6
7	Basic Electricity	1.7.24 - 1.7.27	6
8	Mensuration	1.8.28 - 1.8.31	5
Total			40 Hrs

LEARNING / ASSESSABLE OUTCOME

On completion of this book you shall be able to

- **Demonstrate basic mathematical concept and principles to perform practical operations.**
- **Understand and explain basic science in the field of study.**

CONTENTS

Exercise No.	Title of the Exercise	Page No.
	Unit, Fractions	
1.1.01	Unit, Fractions - Classification of unit system	1
1.1.02	Unit, Fractions - Fundamental and Derived units F.P.S, C.G.S, M.K.S and SI units	2
1.1.03	Unit, Fractions - Measurement units and conversion	3
1.1.04	Unit, Fractions - Factors, HCF, LCM and problems	8
1.1.05	Unit, Fractions - Fractions - Addition, subtraction, multiplication & division	9
1.1.06	Unit, Fractions - Decimal fractions - Addition, subtraction, multiplication & division	12
1.1.07	Unit, Fractions - Solving problems by using calculator	15
	Square root, Ratio and Proportions, Percentage	
1.2.08	Square root, Ratio and Proportions, Percentage - Square and square root	19
1.2.09	Square root, Ratio and Proportions, Percentage - Simple problems using calculator	20
1.2.10	Square root, Ratio and Proportions, Percentage - Applications of pythagoras theorem and related problems	21
1.2.11	Square root, Ratio and Proportions, Percentage - Ratio and proportion	23
1.2.12	Square root, Ratio and Proportions, Percentage - Ratio and proportion - Direct and indirect proportions	25
1.2.13	Square root, Ratio and Proportions, Percentage - Percentage	28
1.2.14	Square root, Ratio and Proportions, Percentage - Changing percentage to decimal and fraction	30
	Material Science	
1.3.15	Material science - Types of metals, types of ferrous and non ferrous metals	31
1.3.16	Material science - Introduction of iron and cast iron	33
	Mass, Weight, Volume and Density	
1.4.17	Mass, Weight, Volume and Density - Mass, volume, density, weight and specific gravity	36
1.4.18	Mass, Weight, Volume and Density - Related problems for mass, volume, density, weight and specific gravity	38
	Speed and Velocity, Work, Power and Energy	
1.5.19	Speed and Velocity, Work, Power and Energy - Work, power, energy, HP, IHP, BHP and efficiency	42
1.5.20	Speed and Velocity, Work, Power and Energy - Potential energy, kinetic energy and related problems with assignment	48

Exercise No.	Title of the Exercise	Page No.
Heat & Temperature and Pressure		
1.6.21	Heat & Temperature and Pressure - Concept of heat and temperature, effects of heat, difference between heat and temperature, boiling point & melting point of different metals and non-metals	51
1.6.22	Heat & Temperature and Pressure - Scales of temperature, celsius, fahrenheit, kelvin and conversion between scales of temperature	53
1.6.23	Heat & Temperature and Pressure - Temperature measuring instruments, types of thermometer, pyrometer and transmission of heat - Conduction, convection and radiation	55
Basic Electricity		
1.7.24	Basic electricity - Introduction and uses of electricity, molecule, atom, how electricity is produced, electric current AC,DC their comparison, voltage, resistance and their units	57
1.7.25	Basic electricity - Conductor, insulator, types of connections - series and parallel	61
1.7.26	Basic electricity - Ohm's law, relation between V.I.R & related problems	66
1.7.27	Basic electricity - Electrical power, energy and their units, calculation with assignments	68
Mensuration		
1.8.28	Mensuration - Area and perimeter of square, rectangle and parallelogram	71
1.8.29	Mensuration - Area and perimeter of triangles	75
1.8.30	Mensuration - Area and perimeter of circle, semi-circle, circular ring, sector of circle, hexagon and ellipse	79
1.8.31	Mensuration - Surface area and volume of solids - Cube, cuboid, cylinder, sphere and hollow cylinder	85

SYLLABUS

1st Year

Workshop Calculation & Science - Electrician - Power Distribution Revised syllabus July 2022 under CTS

S.no.	Title	Time in Hrs
I	Unit, Fractions 1 Classification of Unit System 2 Fundamental and Derived Units F.P.S, C.G.S, M.K.S and SI Units 3 Measurement Units and Conversion 4 Factors, HCF, LCM and Problems 5 Fractions – Addition, Subtraction, Multiplication & Division 6 Decimal Fractions – Addition, Subtraction, Multiplication & Division 7 Solving Problems by using calculator	4
II	Square root, Ratio and Proportions, Percentage 1 Square and Square root 2 Simple problems using calculator 3 Applications of Pythagoras theorem and related problems 4 Ratio and Proportion 5 Ratio and Proportion - Direct and Indirect proportions 6 Percentage 7 Percentage - Changing percentage to decimal and fraction	6
III	Material Science 1 Types of metal, types of ferrous and non ferrous metals 2 Introduction of iron and cast iron	4
IV	Mass, Weight, Volume and Density 1 Mass, volume, density, weight and specific gravity 2 Related problems for mass, volume, density, weight and specific gravity	4
V	Speed and Velocity, Work, Power and Energy 1 Work, power, energy, HP, IHP, BHP and efficiency 2 Potential energy, Kinetic Energy and related problems with assignment	5
VI	Heat & Temperature and Pressure 1 Concept of heat and temperature, effects of heat, difference between heat and temperature, boiling point & melting point of different metals and non-metals 2 Scales of temperature, Celsius, Fahrenheit, Kelvin and Conversion between scales of temperature	6

Workshop Calculation & Science - Electrician - Power Distribution Exercise 1.1.01

Unit, Fractions - Classification of unit system

Necessity

All physical quantities are to be measured in terms of standard quantities.

Unit

A unit is defined as a standard or fixed quantity of one kind used to measure other quantities of the same kind.

Classification

Fundamental units and derived units are the two classifications.

Fundamental units

Units of basic quantities of length, mass and time.

Derived units

Units which are derived from basic units and bear a constant relationship with the fundamental units. E.g. area, volume, pressure, force etc.

Systems of units

- F.P.S system is the British system in which the basic units of length, mass and time are foot, pound and second respectively.
- C.G.S system is the metric system in which the basic units of length, mass and time are centimeter, gram and seconds respectively.
- M.K.S system is another metric system in which the basic units of length, mass and time are metre, kilogram and second respectively.
- S.I. units are referred to as Systems International units which is again of metric and the basic units, their names and symbols are as follows.

Fundamental units and derived units are the two classifications of units.

Length, mass and time are the fundamental units in all the systems (i.e) F.P.S, C.G.S, M.K.S and S.I. systems.

Example

Length: What is the length of copper wire in the roll, if the roll of copper wire weighs 8kg, the dia of wire is 0.9cm and the density is 8.9 gm/cm³?

Solution

mass of copper wire in the roll = 8kg (or) 8000grams

Dia of copper wire in the roll = 0.9cm

Density of copper wire = 8.9 gm/cm³

Area of cross section of copper wire

$$= \frac{\pi d^2}{4} = \frac{\pi \times (0.9^2)}{4} = 0.636 \text{cm}^2$$

Volume of copper wire

$$= \frac{\text{Mass of copper wire}}{\text{Density of copper wire}} = \frac{8000 \text{grams}}{8.9 \text{ gm/cm}^3} = 898.88 \text{cm}^3$$

Length of copper wire

$$= \frac{\text{Volume of copper wire}}{\text{Area of cross section of copper wire}} = \frac{898.88 \text{cm}^3}{0.636 \text{cm}^2} = 1413.33 \text{ cm}$$

Length of copper wire = 1413cm.

Time: The S.I. unit of time, the second, is another base units of S.I., it is defined as the time interval occupied by a number of cycles of radiation from the calcium atom. The second is the same quantity in the S.I. in the British and in the U.S. systems of units.

Fundamental units of F.P.S, C.G.S, M.K.S and S.I

S.No.	Basic quantity	British units		Metric units				International units

Pascal	1 Pa	= 1 N/m ²	1 atm	= 101325 Pa
Bar	1 bar = 10N/cm ²	= 100000 Pa–Torr	1 torr	= $\frac{101325}{760} \approx 133.32 \text{ pa}$
Atmosphere	1 atm	= 1 kgf/cm ²	1 kgf/cm ²	= 735.6 mm of mercury

TEMPERATURE

Scale	Freezing point	Boiling point
Centigrade (°C)	0°C	100°C
Fahrenheit (°F)	32°F	212°F
Kelvin (K)	273K	373K
Reaumur (°R)	0°R	80°R

TEMPERATURE

$$\frac{^\circ\text{R}}{80} = \frac{^\circ\text{C}}{100} = \frac{\text{K} - 273}{100} = \frac{^\circ\text{F} - 32}{180}$$

FORCE

Force	In C.G.S. System : Force (Dyne) = Mass (gm) X Acceleration (cm/sec ²)
	In F.P.S. System : Force (Poundal) = Mass (lb) X Acceleration (ft./sec ²)
	In M.K.S System : Force (Newton) = Mass (Kg) x Acceleration (mtr./sec ²)
1 Dyne	= 1 gm x 1 cm/sec ²
1 Poundal	= 1 lb x 1 ft/sec ²
1 Newton	= 1 kg x 1 mtr/sec ² = 10 ⁵ dynes
1gm weight	= 981 Dynes
1 lb weight	= 32 Poundals
1 kg weight	= 9.81 Newtons

ELECTRICAL QUANTITIES

V	Electric potential	V	Volt	V(W/A)
E	Electromotive force	V	Volt	V(W/A)
I	Electric current	A	Ampere	A
R	Electric resistance	Ω	Ohm	Ω (V/A)
e	Specific resistance	Ω m	Ohm metre	Vm/A
G	Conductance	Ω ⁻¹	Siemens	S

Assignment - Answer the following question.

- Convert 320 kilometres into miles _____
- Convert 16 tons into kilograms _____
- Convert 40 inches into centimetres _____
- Convert 8 metres into feet _____
- Convert 2.5 gallons into litres _____
- Convert 5 litres into gallons _____
- 120°C = _____ °F.
- Expand the abbreviations of the following
 - N/m²
 - RPM
- Convert the following S.I. units as required.
 - Length
 - 3.4 m = _____ mm
 - 10.2 km = _____ mile
 - Mass
 - 650 g = _____ kg
 - 120 mg = _____ g
 - Force
 - 1.2 N = _____ kg
 - 25 kg = _____ N
 - Work, energy, amount of heat
 - 120 KJ = _____ J
 - 300 wh = _____ kwh
 - Power
 - 0.2 kW = _____ W
 - 350 W = _____ kW
 - Convert as required.
 - 5 N = _____ KN

Unit, Fractions - Factors, HCF, LCM and problems

Prime Numbers and whole Numbers

Factor

A factor is a small number which divides exactly into a bigger number.e.g.

To find the factors of 24, 72, 100 numbers

$$24 = 2 \times 2 \times 2 \times 3$$

$$72 = 2 \times 2 \times 2 \times 3 \times 3$$

$$100 = 2 \times 2 \times 5 \times 5$$

The numbers 2,3,5 are called factors.

Definition of a prime factor

Prime factor is a number which divides a prime number into factors.e.g.

$$57 = 3 \times 19$$

The numbers 3 and 19 are prime factors.

They are called as such, since 3 & 19 also belong to prime number category.

Definition of H.C.F

The Highest Common Factor

The H.C.F of a given group of numbers is the highest number which will exactly divide all the numbers of that group.e.g.

To find the H.C.F of the numbers 24, 72, 100

$$24 = 2 \times 2 \times 2 \times 3$$

$$72 = 2 \times 2 \times 2 \times 3 \times 3$$

$$100 = 2 \times 2 \times 5 \times 5$$

The factors common to all the three numbers are

$$2 \times 2 = 4. \text{ So HCF} = 4.$$

Definition of L.C.M

Lowest common multiple

The lowest common multiple of a group of numbers is the smallest number that will contain each number of the given group without a remainder.e.g.

- Factorise the following numbers

$$7,17,20,66,128$$

7,17 - These two belong to Prime numbers. Hence no factor except unity and itself.

$$\begin{array}{r|l} 2 & 20 \\ 2 & 10 \\ & 5 \end{array}$$

Factors of 20 = $2 \times 2 \times 5$

$$\begin{array}{r|l} 2 & 66 \\ 3 & 33 \\ & 11 \end{array}$$

Factors of 66 = $2 \times 3 \times 11$

$$\begin{array}{r|l} 2 & 128 \\ 2 & 64 \\ 2 & 32 \\ 2 & 16 \\ 2 & 8 \\ 2 & 4 \\ & 2 \end{array}$$

Factors of 128 = $2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2$

- Select prime numbers from 3 to 29
3,5,7,11,13,17,19,23,29
- Find the HCF of the following group of numbers HCF of 78, 128, 196

$$\begin{array}{r|l} 2 & 78 \\ 3 & 39 \\ & 13 \end{array}$$

$$78 = 2 \times 3 \times 13$$

$$\begin{array}{r|l} 2 & 128 \\ 2 & 64 \\ 2 & 32 \\ 2 & 16 \\ 2 & 8 \\ 2 & 4 \\ & 2 \end{array}$$

$$128 = 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2$$

$$\begin{array}{r|l} 2 & 196 \\ 2 & 98 \\ & 49 \end{array}$$

$$196 = 2 \times 2 \times 49$$

$$\text{HCF} = 2$$

- Find LCM of 84,92,76

$$\text{LCM} = \begin{array}{r|l} 2 & 84, 92, 76 \\ 2 & 42, 46, 38 \\ 3 & 21, 23, 19 \\ & 7, 23, 19 \end{array}$$

$$\text{LCM} = 2 \times 2 \times 3 \times 7 \times 23 \times 19 = 36708$$

- To find out the LCM of 36, 108, 60

$$\begin{array}{r|l} 2 & 36, 108, 60 \\ 2 & 18, 54, 30 \\ 3 & 9, 27, 15 \\ 3 & 3, 9, 5 \\ & 1, 3, 5 \end{array}$$

LCM of the number

$$36, 108, 60 = 2 \times 2 \times 3 \times 3 \times 3 \times 5 = 540$$

The necessity of finding LCM and HCF arises in subtraction and addition of fractions.

Unit, Fractions - Fractions - Addition, subtraction, multiplication & division

Description

A minimal quantity that is not a whole number. For e.g. .

$\frac{1}{5}$ a vulgar fraction consists of a numerator and denominator.

Numerator/Denominator

The number above the line in a vulgar fraction showing how many of the parts indicated by the denominator are taken is the numerator. The total number of parts into which the whole quantity is divided and written below the line in a vulgar fraction is the denominator. e.g.

$$\frac{1}{4}, \frac{3}{4}, \frac{7}{12}$$

1,3,7 - numerators 4,12 - denominators

Fraction: Concept

Every number can be represented as a fraction.e.g.

$1\frac{1}{4} = \frac{5}{4}$, A full number can be represented as an apparent fraction.e.g. (Fig 1)

Fraction: Value

The value of a fraction remains the same if the numerator and denominator of the fraction are multiplied or divided by the same number.(Fig 2)

Multiplication

When fractions are to be multiplied, multiply all the numerators to get the numerator of the product and multiply all the denominators to form the denominator of the product. (Fig 3)

Division

When a fraction is divided by another fraction the dividend is multiplied by the reciprocal of the divisor. (Fig 4)

Addition and Subtraction

The denominators of the fractions should be the same when adding or subtracting the fractions. Unequal denominators must first be formed into a common denominator. It is the lowest common denominator and it is equal to the product of the most common prime numbers of the denominators of the fractions in question.(Fig 5)

Examples

- Multiply $\frac{3}{4}$ by $\frac{2}{3}$,

$$\frac{3}{4} \times \frac{2}{3} = \frac{6}{12} = \frac{1}{2}$$

- Divide $\frac{3}{8}$ by $\frac{3}{4}$,

$$\frac{3}{8} \div \frac{3}{4} = \frac{3}{8} \times \frac{4}{3} = \frac{1}{2}$$

- Add $\frac{3}{4}$ and $\frac{2}{3}$,

$$\frac{3}{4} + \frac{2}{3} = \frac{9}{12} + \frac{8}{12} = \frac{17}{12} = 1\frac{5}{12}$$

- sub $\frac{7}{16}$ from $\frac{17}{32}$

$$\frac{17}{32} - \frac{7}{16} = \frac{17}{32} - \frac{14}{32} = \frac{(17 - 14)}{32} = \frac{3}{32}$$

Types of fractions

- Proper fractions are less than unity. Improper fractions have their numerators greater than the denominators.
- A mixed number has a full number and a fraction.

Addition of fraction

$$\text{Add } \frac{1}{2} + \frac{1}{8} + \frac{5}{12}$$

To add these fractions we have to find out L.C.M of denominators 2,8,12.

Find L.C.M of 2,8,12

Step 1 L.C.M

2	2,8,12
2	1,4,6
	1,2,3

Factors are 2,2,2,3

Hence L.C.M = $2 \times 2 \times 2 \times 3 = 24$

Step 2

$$\begin{aligned} \frac{1}{2} + \frac{1}{8} + \frac{5}{12} &= \frac{12}{24} + \frac{3}{24} + \frac{10}{24} \\ &= \frac{12+3+10}{24} = \frac{25}{24} = 1\frac{1}{24} \end{aligned}$$

Subtraction of fraction

$$\text{subtract } 9\frac{15}{32} \text{ from } 17\frac{9}{16} \text{ or } (17\frac{9}{16} - 9\frac{15}{32})$$

Step 1: Subtract whole number first $17 - 9 = 8$

Step 2: L.C.M of 16,32 = 32

Since number 16 divides the number 32

$$\text{Subtracting fractions} = \frac{3}{32}$$

Adding with whole number from Step 1

$$\text{we get } 8 + \frac{3}{32} = 8\frac{3}{32}$$

Common fractions

Problems with plus and minus sign

Example

$$\text{solve } 3\frac{3}{4} + 6\frac{7}{8} - 4\frac{5}{16} - \frac{9}{32}$$

Rule to be followed

- 1 Add all whole numbers
- 2 add all + Numbers
- 3 Add all - Numbers
- 4 Find L.C.M of all denominators

Solution

Step 1: Add whole numbers = $3 + 6 - 4 = 5$

$$\text{Step 2: Add fractions} = \frac{3}{4} + \frac{7}{8} - \frac{5}{16} - \frac{9}{32}$$

L.C.M of 4,8,16,32 is 32

$$\begin{aligned} &\frac{24 + 28 - 10 - 9}{32} \\ &= \frac{52 - 19}{32} \\ &= \frac{33}{32} = 1\frac{1}{32} \end{aligned}$$

Step 3: Adding again with the whole number

$$\text{we get } 5 + 1\frac{3}{32} = 6\frac{3}{32}$$

Examples

Common fractions

- Multiply

$$\text{a } \frac{3}{8} \text{ by } \frac{4}{7} = \frac{3}{8} \times \frac{4}{7} = \frac{3}{14} \quad \text{b } \frac{2}{3} \times \frac{3}{4} \times \frac{5}{8} = \frac{5}{16}$$

- Division

$$\text{a } \frac{5}{16} \div \frac{5}{32} = \frac{5}{16} \times \frac{32}{5} = 2$$

$$\text{b } 4\frac{2}{3} \div 3\frac{1}{7} = \frac{14}{3} \div \frac{22}{7} = \frac{14}{3} \times \frac{7}{22} = \frac{49}{33} = 1\frac{16}{33}$$

- Addition

$$\frac{1}{2} + \frac{1}{4} + \frac{1}{8}$$

L.C.M = 2,4,8 = 8

$$\frac{1}{2} + \frac{1}{4} + \frac{1}{8} = \frac{4+2+1}{8} = \frac{7}{8}$$

- Subtraction

$$5\frac{1}{4} - 3\frac{3}{4} = 5 - 3 + \frac{1}{4} - \frac{3}{4}$$

$$= 2 + \frac{1}{4} - \frac{3}{4} = 2 - \frac{2}{4}$$

$$= \frac{9}{4} - \frac{3}{4} = \frac{9-3}{4}$$

$$= \frac{6}{4} = \frac{3}{2} = 1\frac{1}{2}$$

Assignment

1 Convert the following into improper fractions.

a $1\frac{2}{7} = \underline{\hspace{2cm}}$

b $4\frac{3}{5} = \underline{\hspace{2cm}}$

c $3\frac{3}{5} = \underline{\hspace{2cm}}$

2 Convert the following into mixed numbers.

a $\frac{12}{11} = \underline{\hspace{2cm}}$

b $\frac{36}{14} = \underline{\hspace{2cm}}$

c $\frac{18}{10} = \underline{\hspace{2cm}}$

3 Place the missing numbers.

a $\frac{11}{13} = \frac{x}{91}$ _____

b $\frac{3}{5} = \frac{42}{x}$ _____

c $\frac{9}{14} = \frac{x}{98}$ _____

4 Simplify.

a $\frac{45}{60} = \underline{\hspace{2cm}}$

b $\frac{8}{12} = \underline{\hspace{2cm}}$

5 Multiply.

a $5 \times \frac{2}{3} = \underline{\hspace{2cm}}$

b $\frac{3}{4} \times 2 = \underline{\hspace{2cm}}$

c $\frac{3}{4} \times \frac{5}{6} = \underline{\hspace{2cm}}$

6 Divide

a $\frac{1}{4} \div \frac{3}{4} = \underline{\hspace{2cm}}$

b $6 \div \frac{3}{4} = \underline{\hspace{2cm}}$

c $\frac{3}{4} \div \frac{2}{7} = \underline{\hspace{2cm}}$

7 Place the missing numbers.

a $\frac{2}{3} = \frac{1}{12} \times \underline{\hspace{2cm}}$

b $\frac{14}{24} = \frac{1}{12} \times \underline{\hspace{2cm}}$

c $\frac{7}{8} = \frac{1}{12} \times \underline{\hspace{2cm}}$

8 Add the followings:

a $\frac{3}{4} + \frac{7}{12} = \underline{\hspace{2cm}}$

b $\frac{7}{8} + \frac{3}{4} = \underline{\hspace{2cm}}$

9 Subtract

a $\frac{4}{5} - \frac{2}{5} = \underline{\hspace{2cm}}$

b $\frac{5}{6} - \frac{3}{4} = \underline{\hspace{2cm}}$

10 Simplify

a $2\frac{6}{7} - \frac{3}{8} - \frac{1}{3} - 1\frac{1}{16} = \underline{\hspace{2cm}}$

b $2\frac{2}{7} - \frac{5}{6} + 8 = \underline{\hspace{2cm}}$

11 Express as improper fractions

a $5\frac{3}{4}$

b $3\frac{5}{64}$

c $1\frac{5}{12}$

Workshop Calculation & Science - Electrician - Power Distribution Exercise 1.1.06

Unit, Fractions - Decimal fractions - Addition, subtraction, multiplication & division

Description

Decimal fraction is a fraction whose denominator is 10 or powers of 10 or multiples of 10 (i.e.) 10, 100, 1000, 10000 etc. Meaning of a decimal number:-

12.3256 means

$$(1 \times 10) + (2 \times 1) + \frac{3}{10} + \frac{2}{100} + \frac{5}{1000} + \frac{6}{10000}$$

Representation

The denominator is omitted. A decimal point is placed at different positions of the number corresponding to the magnitude of the denominator

$$\text{Ex. } \frac{5}{10} = 0.5, \frac{35}{100} = 0.35, \frac{127}{10000} = 0.0127, \frac{3648}{1000} = 3.648$$

Addition and subtraction

Arrange the decimal fractions in a vertical order, placing the decimal point of each fraction to be added or subtracted, in succession one below the other, so that all the decimal points are arranged in a straight line. Add or subtract as you would do for a whole number and place the decimal point in the answer below the column of decimal points.

Decimal fractions less than 1 are written with a zero before the decimal point. Example: $45/100 = 0.45$ (and not simply .45)

Add $0.375 + 3.686$

$$\begin{array}{r} 0.375 \\ 3.686 \\ \hline 4.061 \end{array}$$

Subtract 18.72 from 22.61

$$\begin{array}{r} 22.61 \\ 18.72 \\ \hline 3.89 \end{array}$$

Multiplication

Ignore the decimal points and multiply as whole numbers. Find the total number of digits to the right of the decimal point. Insert the decimal point in the answer such that the number of digits to the right of the decimal point equals to the sum of the digits found to the right of the decimal points in the problem.

Multiply 2.5 by 1.25

$$= 25 \times 125 = 3125. \text{ The sum of the figures to the right of decimal point is 3. Hence the answer is } 3.125.$$

Division

Move the decimal point of the divisor to the right to make it a full number. Move the decimal point in the dividend to

the same number of places, adding zeroes if necessary. Then divide.

Divide 0.75 by 0.25

$$0.25 \overline{)0.75}$$

$$\frac{0.75}{0.25} \times \frac{100}{100} = \frac{75}{25}$$

$$25 \overline{)75} = 3$$

Move the decimal point in the multiplicand to the right to one place if the multiplier is 10, and to two places if the multiplier is 100 and so on. When dividing by 10 move the decimal point one place to the left, and, if it is by 100, move them point by two places and so on.

Example

Allowance allowing 3 mm for cutting off each pin, how many pins can be made from a 900 mm long bar and how much material will be left out?

$$\begin{aligned} \text{Total Length of pin} &= 2.25 + 55.36 + 12.18 \\ &= 69.79 \text{ mm} \end{aligned}$$

$$\text{Cutting allowance} = 3 \text{ mm}$$

$$\begin{aligned} \text{Total Length} &= \text{length of pin} + \text{cutting allowance} \\ &= 69.79 \text{ mm} + 3 \text{ mm} \\ &= 72.79 \text{ mm} \end{aligned}$$

$$\text{Length of the bar} = 900 \text{ mm}$$

$$\begin{aligned} \text{No. of pins to be cut} &= \frac{900}{72.79} = 12.394 \\ &= 12 \text{ pins} \end{aligned}$$

$$\begin{aligned} \text{Left out material} &= \text{Total length} - \text{length of pin} + \text{cutting allowance} \\ &= 900 - 12 \times 69.79 + 12 \times 3 \\ &= 900 - 837.48 + 36 \\ &= 900 - 873.48 \end{aligned}$$

$$\text{Left out length} = 26.52 \text{ mm}$$

Conversion of Decimals into fractions and vice-versa

- Convert decimal into fractions

Example

Convert 0.375 to a fraction

Now place 1 under the decimal point followed by as many zeros as there are numbers

$$0.375 = \frac{375}{1000} = \frac{15}{40} = \frac{3}{8}$$

$$0.375 = \frac{3}{8}$$

- Convert fraction into decimal

Example

- Convert $\frac{9}{16}$ to a decimal

Proceed to divide $\frac{9}{16}$ in the normal way of division but put zeros (as required) after the number 9 (Numerator)

$$\begin{array}{r} 0.5625 \\ 16 \overline{)90000} \\ \underline{80} \\ 100 \\ \underline{96} \\ 40 \\ \underline{32} \\ 80 \\ \underline{80} \\ 0 \end{array}$$

$$\frac{9}{16} = 0.5625$$

Recurring decimals

While converting from fraction to decimals, some fractions can be divided exactly into a decimal. In some fractions the quotient will not stop. It will continue and keep recurring. These are called recurring decimals.

Examples

- convert $\frac{1}{3}, \frac{2}{3}, \frac{1}{7}$

a $\frac{1}{3} = \frac{10000}{3} = 0.3333$ – Recurring

b $\frac{2}{3} = \frac{20000}{3} = 0.666$ – Recurring

c $\left(\frac{1}{7} = \frac{10000}{7} = 0.142857142 \right)$ – Recurring

Method of writing approximations in decimals

$$\begin{array}{lll} 1.73556 & = & 1.7356 \quad \text{Correct to 4 decimal places} \\ 5.7343 & = & 5.734 \quad \text{Correct to 3 decimal places} \\ 0.9345 & = & 0.94 \quad \text{Correct to 2 decimal places} \end{array}$$

Multiplication and division by 10, 100, 1000

Multiplying decimals by 10

A decimal fraction can be multiplied by 10, 100, 1000 and so on by moving the decimal point to the right by as many places as there are zeros in the multiplier.

- $4.645 \times 10 = 46.45$ (one place)
- $4.645 \times 100 = 464.5$ (two places)
- $4.645 \times 1000 = 4645$ (three places)

Dividing decimals by 10

A decimal fraction can be divided by 10, 100, 1000 and so on, by moving the decimal point to the left by as many places as required in the divisor by putting zeros

Examples

- $3.732 \div 10 = 0.3732$ (one place)
- $3.732 \div 100 = 0.03732$ (two places)
- $3.732 \div 1000 = 0.003732$ (three places)

Examples

- Rewrite the following number as a fraction

453.273

$$= (4 \times 100) + (5 \times 10) + (3 \times 1) + \frac{2}{10} + \frac{7}{100} + \frac{3}{100}$$

$$= 453 \frac{273}{1000}$$

- Write the representation of decimal places in the given number 0.386

- 3 - 1st decimal place
- 8 - 2nd decimal place
- 6 - 3rd decimal place

- Write approximations in the following decimals to 3 places.

- a $6.9453 \longrightarrow 6.945$
- b $8.7456 \longrightarrow 8.746$

- Convert fraction to decimal

$$\frac{21}{24} = \frac{7}{8} = 0.875$$

- Convert decimal to fraction

$$0.0625 = \frac{625}{10000} = \frac{5}{80} = \frac{1}{16}$$

Assignment

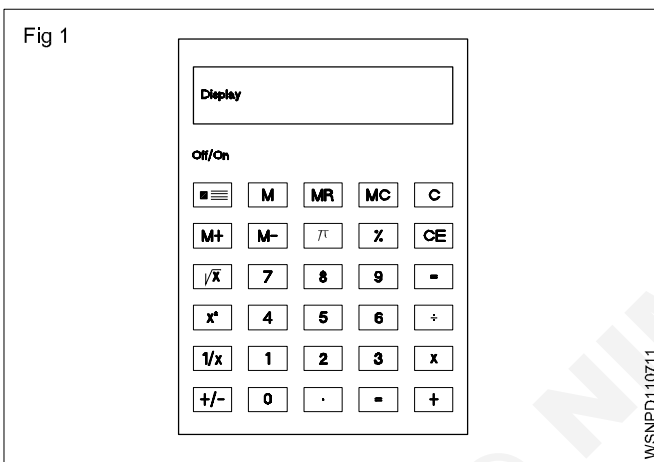

- 1 Write down the following decimal numbers in the expanded form.
- a 514.726
b 902.524
- 2 Write the following decimal numbers from the expansion.
- a $500 + 70 + 5 + \frac{3}{10} + \frac{2}{100} + \frac{9}{1000}$
b $200 + 9 + \frac{1}{10} + \frac{3}{100} + \frac{5}{1000}$
- 3 Convert the following decimals into fractions in the simplest form.
- a 0.72
b 5.45
c 3.64
d 2.05
- 4 Convert the following fraction into decimals
- a $\frac{3}{5}$
b $\frac{10}{4}$
c $24 \frac{54}{1000}$
d $\frac{12}{25}$
e $\frac{8}{25}$
f $1 \frac{3}{25}$
- 5 Addition of decimals
- a $4.56 + 32.075 + 256.6245 + 15.0358$
b $462.492 + 725.526 + 309.345 + 626.602$
- 6 Subtract the following decimals
- a $612.5200 - 9.6479$
b $573.9246 - 215.6000$
- 7 Add and subtract the following
- a $56.725 + 48.258 - 32.564$
b $16.45 + 124.56 + 62.7 - 3.243$
- 8 Multiply the following
- a By 10,100,1000
i 3.754×10
ii 8.964×100
iii 2.3786×1000
iv 0.005×1000
- b By whole numbers
i 8.4×7
ii 56.72×8
- c By another decimal figure (use calculator)
i 15.64×7.68
ii 2.642×1.562
- 9 Divide the following
- a $\frac{62.5}{25}$
b $\frac{64.56}{10}$
c $\frac{0.42}{100}$
d $\frac{48.356}{1000}$
- 10 Division
- a $\frac{16.8}{1.2}$
b $\frac{1.54}{1.1}$
- 11 Change the fraction into a decimal
- i $1 \frac{5}{8}$
ii $\frac{12}{25}$
- 12 Find the value
 $20.5 \times 40 \div 10.25 + 18.50$

Unit, Fractions - Solving problems by using calculator

A pocket calculator allows to spend less time in doing tedious calculations. A simple pocket calculator enables to do the arithmetical calculations of addition, subtraction, multiplication and division, while a scientific type of calculator can be used for scientific and technical calculations also.

No special training is required to use a calculator. But it is suggested that a careful study of the operation manual of the type of the calculator is essential to become familiar with its capabilities. A calculator does not think and do. It is left to the operator to understand the problem, interpret the information and key it into the calculator correctly.

Constructional Details (Fig 1)

The key board is divided into five clear and easily recognizable areas and the display.

• Data entry keys

The entry keys are from 0to 9

and a key for the decimal point . .

• Clearing keys

These keys have the letter 'C'

C CLR Clear totally

CE Clear entry only

CM , MC Clear memory

- + Addition key
- Subtraction key
- x Multiplication key
- ÷ Division key
- = Equals key to display the result

• Function keys

- π Pi key
- √x Square root key
- % Percentage key
- +/- Sign change key
- x² Square key
- 1/x Reciprocal key

• Memory keys

- M Store the display number
- M+ The displayed value is added to the memory
- M- The displayed value is subtracted from the memory
- MR RCL The stored value is recalled on to the display

Further functional keys included in Scientific calculators are as shown in Fig 2.

\sin \cos \tan $($ $)$ For trigonometric functions and for brackets

Exp Exponent key

INV Some of the keys have coloured lettering above or below them. To use a function in coloured lettering, press INV key. INV will appear on the display. Then press the key that the coloured lettering identifies. INV will disappear from the display.

\log , INV 10^x to obtain the logarithm of the displayed number and the antilogarithm of the displayed value.

INV R-P to convert displayed rectangular coordinates into polar coordinates.

INV P-R to convert displayed polar coordinates into rectangular coordinates.

• The display

The display shows the input data, interim results and answers to the calculations.

The arrangement of the areas can differ from one make to another. Keying in of the numbers is done via an internationally agreed upon set of ten keys in the order that the numbers are written.

Rules and Examples:

- **Addition:** Example $18.2 + 5.7$

Sequence	Input	Display
Input of the 1st term of the sum	1 8 $.$ 2	18.2
Press + key	$+$	18.2
Input 2nd term of the sum. the first term goes into the register	5 $.$ 7	5.7
Press the = key	$=$	23.9

- **Subtraction:** Example $128.8 - 92.9$

Sequence	Input	Display
Enter the subtrahend	1 2 8 $.$ 8	128.8
Press - key	$-$	128.8
Enter the minuend. The subtrahend goes into the register	9 2 $.$ 9	92.9
Press the = key	$=$	35.9

- **Multiplication:** Example 0.47×2.47

Sequence	Input	Display
Enter multiplicand	$.$ 4 7	0.47
Press x key	\times	0.47
Enter multiplier, multiplicand goes to register	2 $.$ 4 7	2.47
Press = key	$=$	1.1609

- **Division:** Example $18.5/2.5$

Sequence	Input	Display
Enter the dividend	1 8 $.$ 5	18.5
Press \div Key	\div	18.5
Enter the divisor goes to the register	2 $.$ 5	2.5
Press = key	$=$	7.4

- **Multiplication & Division:**
Example : 2.5 x 7.2 / 4.8 x 1.25

Sequence	Input	Display
Enter 2.5	2 . 5	2.5
Press x key	x	2.5
Enter 7.2	7 . 2	7.2
Press ÷ key	÷	18
Enter Open bracket	(
Enter 4.8	4 . 8	4.8
Press x key	x	4.8
Enter 1.25	1 . 2 5	1.25
Enter Close bracket)	6
Press = key	=	3.0

- Store in memory Example (2+6) (4+3)

Sequence	Input	Display
Workout for the first bracket	2	2
	+	2
	6	6
	=	8
Store the first result in	STO , M	8
x	or M+	
Workout for the 2nd bracket	4	4
	+	4
	3	3
	=	7
Press x key	x	7
Recall memory	RCL or MR	8
Press = key	=	56

- **Percentage:** Example 12% of 1500

Sequence	Input	Display
Enter 1500	1 5 0 0	1500
Press x key	x	1500
Enter 12	1 2	12
Press INV %	INV %	12
Press = key	=	180

- **Square root:** Example $\sqrt{2} + \sqrt{3 \times 5}$

Sequence	Input	Display
Enter 2	2	2
Press \sqrt{a} key	\sqrt{a}	1.414
Press + key	+	1.414
Press bracket key	(1.414
Enter 3	3	3
Press \sqrt{a} key	\sqrt{a}	1.732
Press x key	x	1.732
Enter 5	5	5
Press \sqrt{a} key	\sqrt{a}	2.236
Press bracket close key)	3.873
Press = key	=	5.2871969
	2 \sqrt{a} + (3 \sqrt{a} x 5 \sqrt{a}) =	5.2871969

$$\sqrt{2} + \sqrt{3 \times 5} = 5.287$$

- **Common logarithm:** Example log 1.23

Sequence	Input	Display
	1 . 2 3 log =	0.0899051

- **Power:** Example $123 + 30^2$

Sequence	Input	Display
	1 2 3 + 3 0 INV X ² =	1023

- Before starting the calculations be sure to press the 'ON' key and confirm that '0' is shown on the display.
- Do not touch the inside portion of the calculator. Avoid hard knocks and unduly hard pressing of the keys.
- Maintain and use the calculator in between the two extreme temperatures of 0° and 40° C.

- Never use volatile fluids such as lacquer, thinner, benzene while cleaning the unit.
- Take special care not to damage the unit by bending or dropping.
- Do not carry the calculator in your hip pocket.

Assignment

1 Using calculator solve the following

- $625 + 3467 + 20 + 341 + 6278 = \underline{\hspace{2cm}}$
- $367.4 + 805 + 0.7 + 7.86 + 13.49 = \underline{\hspace{2cm}}$
- $0.043 + 1.065 + 13.0 + 34.76 + 42.1 = \underline{\hspace{2cm}}$
- $47160 + 1368.4 + 0.1 + 1.6901 + 134.267 = \underline{\hspace{2cm}}$

2 Using calculator simplify the following

- $24367 - 4385 = \underline{\hspace{2cm}}$
- $9.643 - 0.7983 = \underline{\hspace{2cm}}$
- $4382.01 - 381.3401 = \underline{\hspace{2cm}}$
- $693.42 - 0.0254 = \underline{\hspace{2cm}}$

3 Using calculator find the values of the following

- $23 \times 87 = \underline{\hspace{2cm}}$
- $1376 \times 0.81 = \underline{\hspace{2cm}}$
- $678 \times 243 = \underline{\hspace{2cm}}$
- $0.75 \times 0.24 = \underline{\hspace{2cm}}$

4 Using calculator solve the following

- $22434 \div 3 = \underline{\hspace{2cm}}$
- $4131 \div 243 = \underline{\hspace{2cm}}$
- $469890 \div 230 = \underline{\hspace{2cm}}$
- $3.026 \div 0.89 = \underline{\hspace{2cm}}$

5 Solve the following

- $\frac{1170 \times 537.5}{13 \times 215} = \underline{\hspace{2cm}}$
- $\frac{28.2 \times 18 \times 3500}{1000 \times 3 \times 0.8} = \underline{\hspace{2cm}}$

6 Solve the following

- $\frac{(634 + 128) \times (384 - 0.52)}{8 \times 0.3} = \underline{\hspace{2cm}}$

$$b \frac{(389 - 12.2) \times (842 - 0.05 - 2.6)}{(3.89 - 0.021) \times (28.1 + 17.04)} = \underline{\hspace{2cm}}$$

7

$$2a = 450 \text{ mm (major axis)}$$

$$2b = 250 \text{ mm (minor axis)}$$

Perimeter of the ellipse

$$A = \underline{\hspace{2cm}} \text{ metre}^2$$

$$\text{Hint } A = \pi \times a \times b \text{ unit}^2$$

8

$$\phi = 782 \text{ mm}$$

$$\alpha = 136^\circ$$

Area of the sector

$$A = \underline{\hspace{2cm}}$$

$$\text{Hint } A = \frac{\pi \times d^2}{4} \times \frac{\alpha}{360^\circ}$$

9

$$d = 1.25 \text{ metre}$$

$$V = \underline{\hspace{2cm}} \text{ dm}^3$$

Volume of sphere

$$\text{Hint } V = \frac{4}{3} \pi r^3$$

10

$$L = 1.2 \text{ metres}$$

$$B = 0.6 \text{ metre}$$

$$H = 0.5 \text{ metre}$$

' ρ ' (rho) density of steel

$$= 7.85 \text{ kg/dm}^3$$

$$m = \underline{\hspace{2cm}} \text{ kg}$$

$$\text{(mass 'm' = V x } \rho \text{)}$$

Square root, Ratio and Proportions, Percentage - Square and square root

- a basic number
- 2 exponent

√ radical sign indicating the square root.

√a² square root of 'a' square

a² radicand

Square number

The square of a number is the number multiplied by itself.

Basic number x basic number = Square number

a x a = a²

4 x 4 = 4² = 16

Splitting up

A square area can be split up into sub-areas. The largest square of 36 is made up of a large square 16, a small square 4 and two rectangles 8 each.

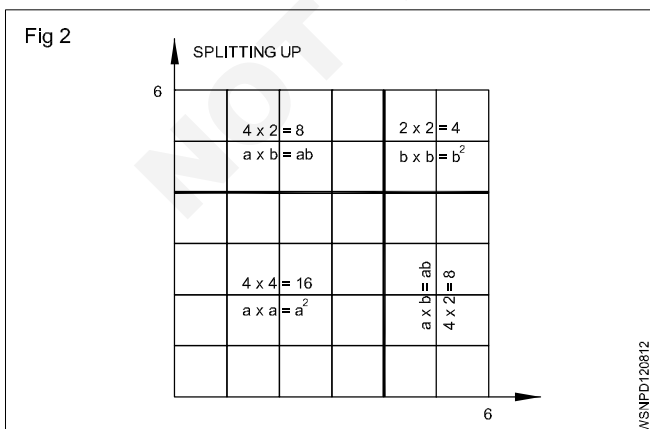

Large square 4 x 4 = 16 a²

Two rectangles 2 x 4 x 2 = 16 2ab

Small square 2 x 2 = 4 b²

Sum of sub-areas = 36 = a² + 2ab + b²

√36 = √a² + 2ab + b²

Result: In order to find the square root, we split up the square numbers.

Extracting the square root procedure

- Starting from the decimal point form groups of two figures towards right and left. Indicate by a prime symbol. √4624.00
- Find the root of the first group, calculate the difference, bring down the next group.
- Multiply the root by 2 and divide the partial radicand.
- Enter the number thus calculated in the divisor for the multiplication.

If there is a remainder, repeat the procedure.

6	46,24
	36
128	1024
	1024
	0

√4624 = 68

Basic number x basic number = Square

√Square number = basic number

Example

The cross-section of a rivet is 3.46 cm². Calculate the diameter of the hole.

Rivet cross-section is the hole cross-section.

To find 'd',

Given that Area = 3.46 cm²

Area = 0.785 x d² (formula)

3.46 cm² = d² x 0.785

$$d^2 = \frac{3.46 \text{ cm}^2}{0.785}$$

$$d = \sqrt{\frac{3.46}{0.785}} \text{ cm}$$

d = 2.1 cm (or) 21mm

Workshop Calculation & Science - Electrician - Power Distribution Exercise 1.2.09

Square root, Ratio and Proportions, Percentage - Simple problems using calculator

1 a $\sqrt{2916} = \underline{\hspace{2cm}}$.

b $\sqrt{45796} = \underline{\hspace{2cm}}$.

c $\sqrt{8.2944} = \underline{\hspace{2cm}}$.

d $\sqrt{63.845} = \underline{\hspace{2cm}}$.

$A = 2025 \text{ mm}^2$
 $a = \underline{\hspace{2cm}} \text{ mm}$

$A = 176.715 \text{ mm}^2$
 $d = \underline{\hspace{2cm}} \text{ mm}$

$A = 65031 \text{ mm}^2$
 $d = 140 \text{ mm}$
 $D = \underline{\hspace{2cm}} \text{ mm}$

$l = 58 \text{ cm}$
 $b = 45 \text{ cm}$
 $A_1 = A_2$
 $a = \underline{\hspace{2cm}} \text{ cm}$

$A = 807.77 \text{ cm}^2$
 $d = 140 \text{ mm}$
 $D = \underline{\hspace{2cm}} \text{ mm}$

$a \times a = 543169 \text{ mm}^2$
 $a = \underline{\hspace{2cm}} \text{ mm}$

$d : l = 1 : 1.5$
 $A = 73.5 \text{ mm}^2$
 $d = \underline{\hspace{2cm}} \text{ mm}$

increase in area
 $A = 12.7\%$
 $A = 360 \text{ mm}^2$
 $d = \underline{\hspace{2cm}} \text{ mm}$
 (d = diameter after the increase in area)

Square root, Ratio and Proportions, Percentage - Applications of pythagoras theorem and related problems

Applications of Pythagoras Theorem

Some of the applications of the Pythagoras theorem are; (Fig 1)

- 1 The Pythagoras theorem is commonly used to find the lengths of sides of a right-angled triangle.
- 2 It is used to find the length of the diagonal of a square.
- 3 Pythagoras theorem is used in trigonometry to find the trigonometric ratios like sin, cos, tan, cosec, sec and cot.
- 4 Pythagoras theorem is used in security cameras for face recognition.
- 5 Architects use the technique of the Pythagoras theorem for engineering and construction fields.
- 6 The Pythagoras theorem is applied in surveying the mountains.
- 7 It is also used in navigation to find the shortest route.
- 8 By using the Pythagoras theorem, we can derive the formula for base, perpendicular and hypotenuse.
- 9 Painters use ladders to paint on high buildings with the help of the Pythagoras theorem.
- 10 Pythagoras theorem is used to calculate the steepness of slopes of hills or mountains.
- 11 The converse of the Pythagoras theorem is used to check whether a triangle is a right triangle or not.

Application of pythagoras theorem in real life

Pythagoras theorem states that

"In a right-angled triangle, the square of the hypotenuse side is equal to the sum of squares of the other two sides".

- 1 The sides of this triangle have been named Perpendicular, Base and Hypotenuse.
- 2 The hypotenuse is the longest side, as it is opposite to the angle 90°.

- 3 The sides of a right triangle (say AB, BC and CA) which have positive integer values, when squared, are put into an equation, also called a Pythagorean triplet.
- 4 To calculate the length of staircase required to reach a window
- 5 To find the length of the longest item can be kept in your room.
- 6 To find the steepness of the hills or mountains.
- 7 To find the original height of a tree broken due to heavy rain and lying on itself
- 8 To determine heights and measurements in the construction sites.

Examples

- 1 What is the side AC if AB = 15 cm, BC = 25 cm.

$$AC^2 = AB^2 + BC^2$$

$$= 15^2 + 25^2$$

$$= 225 + 625 = 850$$

$$AC = \sqrt{850} = 29.155 \text{ cm}$$

- 2 What is the side BC if AB = 10 cm, AC = 30 cm.

$$AC^2 = AB^2 + BC^2$$

$$30^2 = 10^2 + BC^2$$

$$900 = 100 + BC^2$$

$$BC^2 = 900 - 100 = 800$$

$$BC = 28.284 \text{ cm}$$

- 3 What is the side AB if BC = 20 cm, AC = 35 cm.

$$AC^2 = AB^2 + BC^2$$

$$35^2 = AB^2 + 20^2$$

$$1225 = AB + 400$$

$$AB^2 = 1225 - 400 = 825$$

$$AB = 28.72 \text{ cm}$$

- 4 What is the value of side BC if AB = 8 cm, AC = 24 cm.

$$AC^2 = AB^2 + BC^2$$

$$24^2 = 8^2 + BC^2$$

$$576 = 64 + BC^2$$

$$BC^2 = 576 - 64 = 512$$

$$BC = \sqrt{512} = 22.63 \text{ cm}$$

- 5 What is the value side AC if AB = 6.45 cm, BC = 8.52 cm.

$$\begin{aligned} AC^2 &= AB^2 + BC^2 \\ AC^2 &= 6.45^2 + 8.52^2 \\ AC^2 &= 41.60 + 72.59 \\ &= 114.19 \end{aligned}$$

$$AC = \sqrt{114.19} = 10.69 \text{ cm}$$

- 6 What is the value of side AB if BC = 3.26 cm, AC = 8.24 cm.

$$\begin{aligned} AC^2 &= AB^2 + BC^2 \\ 8.24^2 &= AB^2 + 3.26^2 \\ 67.9 &= AB^2 + 10.63 \\ AB^2 &= 67.9 - 10.63 \\ &= 57.27 \end{aligned}$$

$$AB = \sqrt{57.27} = 7.57 \text{ cm}$$

- 7 What is the value of side AB if AC = 12.5 cm, BC = 8.5 cm.

$$\begin{aligned} AC^2 &= AB^2 + BC^2 \\ 12.5^2 &= AB^2 + 8.5^2 \\ 156.25 &= AB^2 + 72.25 \\ AB^2 &= 156.25 - 72.25 \\ &= 84 \end{aligned}$$

$$AB = \sqrt{84} = 9.17 \text{ cm}$$

- 8 A ladder of 12.5 metre long is placed with upper end against a wall. The lower end being 7.5 metres from the wall. What height is the upper end above the ground.

$$\begin{aligned} AC^2 &= AB^2 + BC^2 \\ BC^2 &= AC^2 - AB^2 \\ BC^2 &= x^2 \\ AC^2 &= AB^2 + BC^2 \\ 12.5^2 &= x^2 + 7.5^2 \end{aligned}$$

$$\begin{aligned} x^2 &= (12.5)^2 - (7.5)^2 \\ &= (12.5 + 7.5)(12.5 - 7.5)^2 \\ &= 20 \times 5 \\ &= \sqrt{100} = 10 \end{aligned}$$

$$x = 10 \text{ m}$$

- 9 What is the value of AB.

$$\begin{aligned} AC^2 &= AB^2 + BC^2 \\ AB^2 &= AC^2 - BC^2 \\ AB^2 &= x^2 \\ AC^2 &= AB^2 + BC^2 \\ 10^2 &= x^2 + 6^2 \end{aligned}$$

$$\begin{aligned} x^2 &= 10^2 - 6^2 \\ &= 100 - 36 = 64 \end{aligned}$$

$$\begin{aligned} x &= \sqrt{64} \\ &= 8 \end{aligned}$$

$$AB = 8$$

Assignment

- 1 What is the value of side AB, in a right angled triangle of side AC = 10 cm and BC = 5 cm.
- 2 What is the value of side AC, in a right angled triangle of side AB = 6.5 cm and BC = 4.5 cm.
- 3 What is the value of side BC, in a right angled triangle of side AC = 14.5 cm and AB = 10.5 cm.
- 4 What is the value of side AC, in a right angled triangle of side AB = 7 cm and BC = 5 cm.
- 5 What is the value of side BC, in a right angled triangle of side AC = 13.25 cm and AB = 8.75 cm.

Square root, Ratio and Proportions, Percentage - Ratio and proportion

Ratio

Introduction

It is the relation between two quantities of the same kind and is expressed as a fraction.

Expression

a, b two quantities of the same kind. $\frac{a}{b}$ or a:b or a ÷ b or

a in b is the ratio.

Ratio is always reduced to the lowest terms.

Example

$$7:14 = \frac{7}{14} = \frac{1}{2} = 1:2$$

Proportion

It is the equality between the ratios, a : b is a ratio and c : d is another ratio. Both ratios are equal. Then

$$a : b :: c : d \text{ or } \frac{a}{b} = \frac{c}{d}$$

Example

$$250 : 2000 :: 1 : 8$$

Proportion fundamentals

If $\frac{a}{b} = \frac{c}{d}$ then

- $ad = bc$

- $\frac{a}{c} = \frac{b}{d}$

- $\frac{b}{a} = \frac{d}{c}$

- $\frac{a+b}{b} = \frac{c+d}{c}$ and $\frac{a+b}{a} = \frac{c+d}{d}$

- $\frac{a-b}{b} = \frac{c-d}{d}$

- $\frac{a+b}{b+d} = \frac{a}{c} = \frac{c}{d}$

$$3:4::6:8 \text{ or } \frac{3}{4} = \frac{6}{8}$$

- $3 \times 8 = 6 \times 4$

- $\frac{3}{6} = \frac{4}{8}$

- $\frac{4}{3} = \frac{8}{6}$

- $\frac{3+4}{4} = \frac{6+8}{8}$

- $\frac{3-4}{4} = \frac{6-8}{8}$

- $\frac{3+6}{4+8} = \frac{9}{12} = \frac{3}{4}$

**Ratio - relation of two quantities of the same kind.
Proportion - equality between two ratios.**

Example

- A steel plate of 800 x 1400 mm is to be drawn to a scale of 1:20. What will be the lengths in the Fig 1.

The reduction ratio is $\frac{1}{20}$.

B is reduced from 800 to $800 \times \frac{1}{20} = 40$ mm.

L is reduced from 1400 to $1400 \times \frac{1}{20} = 70$ mm.

- Find the number of teeth of the larger gear in the gear transmission shown in the Fig 2.

Speed ratio = 400 : 300

Teeth ratio = 24:T

$$\frac{400}{300} = \frac{T}{24}$$

$$\therefore T = \frac{24 \times 400}{300} = 32 \text{ Teeth}$$

Find the ratio of A:B:C

If A:B= 2:3 and B:C=4:5

$$A:B = 2:3$$

$$B:C = 4:5$$

$$A:B = 8 : 12 \text{ (Ratio 2:3 multiply by 4)}$$

$$B:C = 12:15 \text{ (Ratio 4:5 multiply by 3)}$$

$$\therefore A:B:C = 8:12:15$$

Assignment

$$l_1 : l_2 = 2:3$$

$$L = 2.75 \text{ metres}$$

$$l_1 = \text{_____ metres}$$

$$l_2 = \text{_____ metres}$$

$$D : d = 1.75 : 1$$

$$D = 35 \text{ mm}$$

$$d = \text{_____ mm}$$

$$d : L \text{ of shaft} = 2:7$$

$$d = 40 \text{ mm}$$

$$L = \text{_____ mm}$$

$$a : s = 5 : 1$$

$$s = 1.5 \text{ mm}$$

$$a = \text{_____ mm}$$

$$D : L = 1:10$$

$$L = 150 \text{ mm}$$

$$D = \text{_____ mm}$$

7 A:B=9:12

B:C=8:10

Then A:B:C= _____

8 A:B=5:6

B:C=3:4

Then A:B:C= _____

$$\frac{\Delta h}{l} = \frac{1}{20}$$

$$l = 140 \text{ mm}$$

$$\Delta h = \text{_____ mm}$$

9 A:55=9:11

A = _____

10 15:9.3=40:x

x = _____

Workshop Calculation & Science - Electrician - Power Distribution Exercise 1.2.12

Square root, Ratio and Proportions, Percentage - Ratio and Proportions - Direct and indirect proportions

Proportion

Description

It is the equality between the ratios, a:b is a ratio and c:d is another ratio. Both ratios are equal. Then

$$a : b :: c : d \quad \text{e.g. } 250 : 2000 :: 1 : 8$$

Rule of three

A three step calculation

statement

single

multiple.

Direct proportion

The more in one the more in the other - An increase in one denomination produces an increase in the other. (Fig 1)

Examples

- 1 4 turners earn 300 Rupees. How much will 6 Turners earn?

Statement

$$4 \text{ turners} = 300 \text{ Rupees}$$

Single

$$1 \text{ Turner} = 75 \text{ Rupees}$$

Multiple

$$6 \text{ Turners} = 6 \times 75 = 450 \text{ Rupees}$$

- 2 One vehicle consumes 30 litres of petrol per day how much petrol is used by 6 Vehicles operating under similar condition.

$$\text{One vehicle uses petrol} = 30 \text{ litres per day.}$$

$$\text{Then six vehicles will use} = 6 \text{ Times as much}$$

$$= 6 \times 30 = 180 \text{ litres/day.}$$

- 3 4 vehicles consumes 120 gallons of petrol per day how much petrol will be used by 12 vehicles operating under the same condition.

$$4 \text{ vehicles use } 120 \text{ gallons per day}$$

$$1 \text{ Vehicle will use } \frac{120}{4} = 30 \text{ gallons/day}$$

$$12 \text{ vehicles will use } 12 \times 30 = 360 \text{ gallons/day}$$

Both examples are called simple proportion because only two quantities were used and the day is common for both ratios.

- 4 If 2 litres of petrol costs Rs 60. Find the cost of 50 litres.

Quantity of Petrol	Cost of Petrol
2 litres	Rs.60
50 litres	x
1 litre petrol	$= \frac{60}{2} = \text{Rs.}30$
50 litres petrol	$= 30 \times 50 = \text{Rs } 1500$

- 5 A 150mm dia gear meshes with 50mm dia gear. If the larger gear has 30 teeth. How many teeth will have the smaller gear have?

Gear dia	No. of Teeth
150 mm	30
50 mm	x

$$x = \frac{50}{150} \times 30 = 10 \text{ teeth.}$$

- 6 A mechanic assembles 7 machines in $2\frac{1}{2}$ days. How long will it take time to assemble 70 machines at the same rate.

Machines	Days
7	$2\frac{1}{2}$
70	x

$$x = \frac{70 \times 2.5}{7} = 25 \text{ days}$$

Assemble for 70 machines will take 25 days.

- 7 A roll of wire weighs 1.24 kg from this roll a piece of 3.7cm long is cut and it is found to weigh 2.93 gm. What is the length of the wire in the roll?

Weight of wire	Length of wire
2.93 gm	3.7 cm
1.24 kg (1240 gm)	x

$$x = \frac{1240}{2.93} \times 3.7 = 1566 \text{ cm}$$

Length of wire = 1566 cm.

Indirect or inverse proportion

The more in one the lesser other - Increase in one quantity will produce a decrease in the other. (Fig 2)

Example

- 1 4 turners finish a job in 300 hours. How much time will 6 turners take to do the same job?

Solution procedure in three steps:

Statement 4 turners taken = 300 hours

The time will reduce if 6 turners to do the same job. Therefore this is inverse proportion.

Multiple fraction $\frac{4 \text{ Turners}}{6 \text{ Turners}} \times 300 \text{ hours}$

6 Turners = 200 hours

Result - The more the less.

- 2 8 workman take 6 days to complete a job. How many days it will take for 4 workman to complete the same job?

Workman	Days
8	6
4	x

$$x = \frac{8}{4} \times 6 = 12 \text{ days}$$

4 workers complete the work = 12 days.

- 3 5 men working on a job finished it in 32 days. Find out in how many days 8 men will finish the same job?

Men	Days
5	32
8	x

$$x = \frac{5 \times 32}{8} = 4 \times 5 = 20 \text{ days}$$

8 men will complete the job = 20 days.

- 4 An engine running at 150 rpm drives a shaft by pulley diameter is 55cm and that of the driven shaft pulley is 33 cm. Find the speed of the shaft?

Dia of pulley	Rpm of shaft
55 cm	150
33 cm	x

$$x = \frac{55 \times 150}{33} = 250 \text{ rpm.}$$

Speed of the 33cm diameter will run 250 rpm.

- 5 A pulley of 80 cm diameter is rotating at 100 rpm and drives another pulley of 40 cm diameter. Find the rpm of driven pulley. If slip is 2.5% find the rpm?

Dia of pulley	Rpm of pulley
80 cm	100
40 cm	x

40 cm diameter = 200 rpm.

Slip is 2.5% = 195 rpm.

Problems involving both

Example

2 turners need 3 days to produce 20 pieces. How long will it take for 6 turners to produce 30 such pieces?

Statement

2 turners, 20 pieces = 3 days

6 turners, 30 pieces = how many days.

First step (Fig 3)

Statement 2 turners for 20 pieces = 3 days

1 turner for 20 pieces = $3 \times 2 = 6$ days

Multiple 6 turners for 20 pieces = $\frac{6}{6} = 1$ day

Statement 6 turners for 20 pieces = 1 day

Single 6 turners for 1 piece = $\frac{1}{20}$ days

Multiple 6 turners for 30 pieces = $\frac{1}{20} \times 30 = 1.5$ days

Inverse proportion - More the less.

Second step (Fig 4)

Direct proportion - More the more.

Solve the problem by first writing the statement and proceed to single and then to the multiple according to the type of proportion that is involved.

Introduction

Proportional fundamentals, as applicable to motor vehicle calculations are discussed below.

Simple Proportion

- Proportion

This is an equality between two ratios

Compound and Inverse proportions

- Compound proportions

Example

5 Fitter take 21 days to complete overhauling of 6 vehicles how long 7 Fitters will take to over haul 8 vehicles (Assume time of overhauling each vehicle is constant)

In this both direct and indirect proportions are used.

- 1 Fitter will overhauling 1 vehicle in days (shorter time).
- Quantities (No. of days) are taken in last as that is the answer required in this case.

Fitters	Vehicle	Days
5	6	21
7	8	x

$$\left(\frac{21 \times 5}{6 \times 7} \times 8\right) = 20 \text{ days}$$

Ans: 7 Fitters will overhaul 8 vehicles in 20 days.

Inverse proportion

Some times proportions are taken inversely.

Examples

- If one water pump fills the fuel tank in 12 minutes, two pumps will take half the time taken.

The time should not be doubled.

- 2 pumps will take 30 minutes to fill up a tank how long will 6 similar pumps take this to fill this tank.

Pump	Time
2	30
6	x

Ans: Time taken by 6 pumps = $\frac{30 \times 2}{6} = 10 \text{ minutes}$

Assignment

Length = 6.1 metre
Weight = 32 kgf
Weight of 1 metre of the same channel = _____ kgf

$d_1 = 120 \text{ mm}$
 $d_2 = 720 \text{ mm}$
 $n_1 = 1200 \text{ rpm}$
 $n_2 = \text{_____ rpm}$

$Z_1 = 42 \text{ T}$
 $n_2 = 96 \text{ rpm}$
 $n_1 = 224 \text{ rpm}$
 $Z_2 = \text{_____ T}$

$D = 50 \text{ mm}$
 $H = 80 \text{ mm}$
 $h = 36 \text{ mm}$
 $d = \text{_____ mm}$

- If a mechanic assembles 8 machines in 3 days, how long he will take to assemble 60 machines.
- In an auto shop the grinding wheel makes 1000 rpm and the driven pulley is 200 mm dia. If the driving pulley is 150 mm dia. Find out the rpm of the driving pulley.
- In a gearing of a vehicle the following facts are found. A 180 mm dia of gear meshes with 60mm dia gear. If the bigger gear makes 60 rpm. What will be the rpm of smaller gear.
- A vehicular job is completed by 5 mechanics in 4 days. If only 3 mechanics are available, in how many days the work can be completed.

Square root, Ratio and Proportions, Percentage - Percentage

Percentage

Percentage is a kind of fraction whose denominator is always 100. The symbol for percent is %, written after the number. e.g. 16%.

Ex. $\frac{16}{100} = 0.16$

In decimal form, it is 0.16. Percentage calculation also involves rule of three. The statement (the given data), for unit, and then to multiple which is for calculating the answer. (Fig 1)

Example

The amount of total raw sheet metal to make a door was 3.6 metre² and wastage was 0.18 metre². Calculate the % of wastage. (Fig 2)

Solution procedure in three steps.

Statement:

Area of door (A) = 3.6 m² = 100 %.

Wastage = 0.18 m²

Single: $\frac{100}{3.6} \times 1 \text{ m}^2$

Multiple: for 0.18 m² = $\frac{100}{3.6} \times 0.18$.

Wastage = 5%.

Analyse the given data and proceed to arrive at the answer through the unit.

Example

A fitter receives a take-home salary of 984.50 rupees.

If the deduction amounts to 24%, what is his total salary? (Fig 3)

Total pay 100%

Deduction 24%

Take home salary 76%

If the take home pay is Rs.76, his salary is 100.

For 1% it is $\frac{1}{76}$

For Rs.984.50, it is $\frac{1}{76} \times 984.50$.

For 100% it is $\frac{984.50}{76} \times 100 = 1295.39$

100% i.e. gross pay = Rs.1295.40.

Example 1

75 litres of oil is taken out from a oil barrel of 200 litres capacity. Find out the percentage taken in this.

Solution

% of oil taken = Oil taken out (litres) / Capacity of Barrel (litres) x 100

$= \frac{75}{200} \times 100 = 37\frac{1}{2}\%$

Example 2

A spare part is sold with 15%. Profit to a customer, to a price of Rs.15000/-. Find out the following (a) What is the purchase price (b) What is the profit.

Solution: CP = x ,

CP = cost price

SP = sale price

SP=CP+15%of CP

$15000 = x + \frac{15x}{100} = \frac{100x + 15x}{100}$

$x = \frac{1500000}{115} = 13043.47$

Profit = SP-CP = 15000-13043.47 = 1956.53

Purchase price = Rs.13,043/, Profit = Rs. 1957

Example 3

Out of 80000 cars, which were tested on road, only 16000 cars had no fault. What is the percentage in this acceptance.

$$= \frac{16000}{80000} \times 100 = \frac{100}{5} = 20\%$$

Example 4

The price of a motor cycle dropped to 92% of original price and now sold at Rs. 18000/- What was the original price.

Solution

Present price of Motor cycle Rs. 18000

This is the value of 92% of original price

$$\begin{aligned} \text{Original Price} &= 18000 \times \frac{100}{92} = \frac{1800000}{92} \\ &= \text{Rs. } 19565 \end{aligned}$$

Example 5

A Motor vehicle uses 100 litres of Petrol per day when travelling at 30 kmph. After top overhauling the consumption falls to 90 litres per day. Calculate percentage of saving.

Solution

Percentage of saving = Decrease in consumption / Original consumption x 100

$$= (100 - 90) \frac{\text{litres}}{100} \times 100$$

$$= \frac{10}{100} \times 100$$

= 10% Saving in fuel.

Assignment

1

a = 400mm (side of square)
d = 400 mm
Wastage = _____ %.

2

d = 26mm
'a' depth of u/cut = 2.4mm
reduction of area at cross-section = _____ %

3

Percentage of increase = 36%
Value of increase = 611.2 N/mm²
Original tensile strength = _____ N/mm².

4

Copper in alloy = 27 kg
Zinc in alloy = 18 kg
% of Copper = _____ %
% of Zinc = _____ %.

5

Weight of alloy = 140 Kgf
Weight of Sn 40%
Pb = _____ Kgf
Sn = _____ Kgf.

6

Shaded portion = _____ %.

7

Compression length = _____ %.

8

d = 360 mm
a = 0.707 x d
Wastage = _____ %.

9

Cu = 36 Kg
Zn = 24 Kg
Cu = _____ %
Zn = _____ %

10

Cu = 42.3 Kg
Sn = 2.7 Kg
Cu _____ %
Sn = _____ %.

4 90%

Material science - Types of metal, types of ferrous and non ferrous metals

Types of metals

The metals is of two types:

- 1 Ferrous metal
- 2 Non-ferrous metal

1 Ferrous metals : The metals that contains major part of iron and contain carbon are called ferrous metals such as pig iron, mild steel, nickel etc., they have iron properties such as rusting, magnetisations etc.

2 Non-ferrous metals : The metals that do not contains iron or carbon and do not have the property of iron are called non-ferrous metals such as copper, aluminum etc.

Ferrous and Non ferrous alloys

Alloying metals and ferrous alloys

An alloy is formed by mixing two or more metals together by melting.

For ferrous metals and alloys, iron is the main constituent metal. Depending on the type and percentage of the alloying metal added, the property of the alloy steel will vary.

Metals commonly used for making alloy steels

Nickel (Ni)

This is a hard metal and is resistant to many types of corrosion rust.

It is used in industrial applications like nickel, cadmium batteries, boiler tubes, valves of internal combustion engines, engine spark plugs etc. The melting point of nickel is 1450°C. Nickel can be magnetised. In the manufacture of permanent magnets a special nickel steel alloy is used. Nickel is also used for electroplating. Invar steel contains about 36% nickel. It is tough and corrosion resistant. Precision instruments are made of Invar steel because it has the least coefficient of expansion.

Nickel-steel alloys are available containing nickel from 2% to 50%.

Chromium (Cr)

Chromium, when added to steel, improves the corrosion resistance, toughness and hardenability of steel. Chromium steels are available which may contain chromium up to 30%.

Chromium, nickel, tungsten and molybdenum are alloyed for making automobile components and cutting tools.

Chromium is also used for electroplating components. Cylinder liners are chrome-plated inside so as to have wear resistance properties. Stainless steel contains about 13% chromium. Chromium-nickel steel is used for bearings. Chrome-vanadium steel is used for making hand tools like spanners and wrenches.

Manganese (Mn)

Addition of manganese to steel increases hardness and strength but decreases the cooling rate.

Manganese steel can be used to harden the outer surface for providing a wear resisting surface with a tough core. Manganese steel containing about 14% manganese is used for making agricultural equipment like ploughs and blades.

Silicon (Si)

Addition of silicon for alloying with steel improves resistance to high temperature oxidation.

This also improves elasticity, and resistance against corrosion. Silicon alloyed steels are used in manufacturing springs and certain types of steel, due to its resistance to corrosion. Cast iron contains silicon about 2.5%. It helps in the formation of free graphite which promotes the machinability of cast iron.

Tungsten (W)

The melting temperature of tungsten is 3380° C. This can be drawn into thin wires.

Due to this reason it is used to make filaments of electric lamps.

Tungsten is used as an alloying metal for the production of high speed cutting tools. High speed steel is an alloy of 18% tungsten, 4% chromium and 1% vanadium.

Stellite is an alloy of 30% chromium, 20% tungsten, 1 to 4% carbon and the balance cobalt.

Vanadium (Va)

This improves the toughness of steel. Vanadium steel is used in the manufacture of gears, tools etc. Vanadium helps in providing a fine grain structure in tool steels.

Chrome-vanadium steel contains 0.5% to 1.5% chromium, 0.15% to 0.3% vanadium, 0.13% to 1.10% carbon.

This alloy has high tensile strength, elastic limit and ductility. It is used in the manufacture of springs, gears, shafts and drop forged components.

Vanadium high speed steel contains 0.70% carbon and about 10% vanadium. This is considered as a superior high speed steel.

Cobalt (Co)

The melting point of cobalt is 1495°C. This can retain magnetic properties and wear- resistance at very high temperatures. Cobalt is used in the manufacture of magnets, ball bearings, cutting tools etc. Cobalt high speed steel (sometimes known as super H.S.S.) contains about 5 to 8% cobalt. This has better hardness and wear resistance properties than the 18% tungsten H.S.S.

Molybdenum (Mo)

The melting point of molybdenum is 2620°C. This gives high resistance against softening when heated. Molybdenum high speed steel contains 6% of molybdenum, 6% tungsten, 4% chromium and 2% vanadium. This high speed steel is very tough and has good cutting ability.

Cadmium (cd)

The melting point of cadmium is 320°C. This is used for coating steel components.

Alloying Metals and Non Ferrous Alloys

Non-ferrous Metals And Alloys

Copper and its alloys

Metals without iron are called non-ferrous metals. Eg. Copper, Aluminium, Zinc, Lead and Tin.

Copper

This is extracted from its ores 'MALACHITE' which contains about 55% copper and 'PYRITES' which contains about 32% copper.

Properties

Reddish in colour. Copper is easily distinguishable because of its colour.

The structure when fractured is granular, but when forged or rolled it is fibrous.

It is very malleable and ductile and can be made into sheets or wires.

It is a good conductor of electricity. Copper is extensively used as electrical cables and parts of electrical apparatus which conduct electric current.

Copper is a good conductor of heat and also highly resistant to corrosion. For this reason it is used for boiler fire boxes, water heating apparatus, water pipes and vessels in brewery and chemical plants. Also used for making soldering iron.

The melting temperature of copper is 1083°C.

The tensile strength of copper can be increased by hammering or rolling.

Copper Alloys

Brass

It is an alloy of copper and zinc. For certain types of brass small quantities of tin or lead are added. The colour of brass depends on the percentage of the alloying elements. The colour is yellow or light yellow, or nearly white. It can be easily machined. Brass is also corrosion-resistant.

Brass is widely used for making motor car radiator core and water taps etc. It is also used in gas welding for hard soldering/brazing. The melting point of brass ranges from 880 to 930°C.

Brasses of different composition are made for various applications.

Bronze

Bronze is basically an alloy of copper and tin. Sometimes zinc is also added for achieving certain special properties. Its colour ranges from red to yellow. The melting point of bronze is about 1005°C. It is harder than brass. It can be easily machined with sharp tools. The chip produced is granular. Special bronze alloys are used as brazing rods.

Bronze of different compositions are available for various applications.

Lead and its alloys

Lead is a very commonly used non-ferrous metal and has a variety of industrial applications.

Lead is produced from its ore 'GALENA'. Lead is a heavy metal that is silvery in colour when molten. It is soft and malleable and has good resistance to corrosion. It is a good insulator against nuclear radiation. Lead is resistant to many acids like sulphuric acid and hydrochloric acid.

It is used in car batteries, in the preparation of solders etc. It is also used in the preparation of paints.

Lead Alloys

Babbitt metal

Babbitt metal is an alloy of lead, tin, copper and antimony. It is a soft, anti-friction alloy, often used as bearings.

An alloy of lead and tin is used as 'soft solder'.

Zinc and its alloys

Zinc is a commonly used metal for coating on steel to prevent corrosion. Examples are steel buckets, galvanized roofing sheets, etc.

Zinc is obtained from the ore-calamine or blende.

Its melting point is 420° C.

It is brittle and softens on heating; it is also corrosion-resistant. Due to this reason it is used for battery containers and is coated on roofing sheets etc.

Galvanized iron sheets are coated with zinc.

Tin and tin alloys

Tin

Tin is produced from cassiterite or tinstone. It is silvery white in appearance, and the melting point is 231° C. It is soft and highly corrosion-resistant.

It is mainly used as a coating on steel sheets for the production of food containers. It is also used with other metals, to form alloys.

Example: Tin with copper to form bronze. Tin with lead to form solder. Tin with copper, lead and antimony to form Babbitt metal.

Aluminium

Aluminium is a non-ferrous metal which is extracted from 'BAUXITE'. Aluminium is white or whitish grey in colour. It has a melting point of 660° C. Aluminium has high electrical and thermal conductivity. It is soft and ductile, and has low tensile strength. Aluminium is very widely used in aircraft industry and fabrication work because of its lightness. Its application in the electrical industry is also on the increase. It is also very much in use in household heating appliances.

Material science - Introduction of iron and cast iron

Ferrous Metals

Metals which contain iron as a major content are called ferrous metals. Ferrous metals of different properties are used for various purposes.

Introduction of Iron, Cast Iron, wrought Iron and steel

The ferrous metals and alloys used commonly are:

- Pig-iron
- Cast Iron
- Wrought Iron
- Steels and Alloy steels

Different processes are used to produce iron and steel.

Pig-iron (Manufacturing process)

Pig-iron is obtained by the chemical reduction of iron ore. This process of reduction of the iron ore to Pig-iron is known as SMELTING.

The main raw materials required for producing Pig-iron are:

- Iron ore
- Coke
- Flux

Iron ore

The chief iron ores used are:

- magnetite
- hematite
- limonite
- carbonite.

These ores contain iron in different proportions and are naturally available.

Coke

Coke is the fuel used to give the necessary heat to carry on the reducing action. The carbon from the coke in the form of carbon monoxide combines with the iron ore to reduce it to iron.

Flux

This is the mineral substance charged into a blast furnace to lower the melting point of the ore, and it combines with the non-metallic portion of the ore to form a molten slag.

Limestone is the most commonly used flux in the blast furnace.

Properties and use of Pig-iron

Pig-iron is, therefore, refined and remelted and used to produce other varieties of iron and steel.

Cast Iron (Manufacturing process)

The pig-iron which is tapped from the blast furnace is the crude form of raw material for the cupola, and should be further refined for making castings. This refining is carried out in the cupola furnace which is a small form of a blast furnace.

Generally cupolas are not worked continuously like blast furnaces but are run only as and when required.

Cast Iron (Types)

Cast iron is an alloy of iron, carbon and silicon. The carbon content ranges from 2 to 4%.

Types of cast iron

The following are the types of cast iron.

- Grey cast iron
- White cast iron
- Malleable cast iron
- Nodular cast iron

Grey cast iron

This is widely used for the casting of machinery parts and can be machined easily.

Machine base, tables, slideways are made of cast iron because it is dimensionally stable after a period of aging.

Because of its graphite content, cast iron provides an excellent bearing and sliding surface.

The melting point is lower than that of steel and as grey cast iron possesses good fluidity, intricate casting can be made.

Grey cast iron is widely used for machine tools because of its ability to reduce vibration and minimize tool chatter.

Grey cast iron, when not alloyed, is quite brittle and has relatively low tensile strength. Due to this reason it is not used for making components subjected to high stress or impact loads.

Grey cast iron is often alloyed with nickel, chromium, vanadium or copper to make it tough.

Grey cast iron is weldable but the base metal needs preheating.

White cast iron

This is very hard and is very difficult to machine, and for this reason, it is used in components which should be abrasion-resistant.

White cast iron is produced by lowering the silicon content and by rapid cooling. When cooled in this manner, it is called chilled cast iron.

White cast iron cannot be welded.

Malleable cast iron

Malleable cast iron has increased ductility, tensile strength and toughness when compared with grey cast iron.

Malleable cast iron is produced from white cast iron by a prolonged heat-treatment process lasting for about 30 hours.

Nodular cast iron

This is very similar to malleable cast iron. But this is produced without any heat treatment. Nodular cast iron is also known as: **Nodular Iron - Ductile Iron - Spheroidal Graphite Iron**

This has good machinability, castability, resistance to wear, low melting point and hardness.

Malleable and nodular castings are used for machine parts where there is a higher tensile stress and moderate impact loading. These castings are less expensive and are an alternative to steel castings.

Wrought Iron (Manufacturing process) (Fig 1)

Wrought iron is the purest form of iron. The analysis of Wrought iron shows as much as 99.9% of iron. (Fig 1) When heated, wrought iron does not melt, but only becomes pasty and in this form it can be forged to any shape.

Modern methods used to produce wrought iron in large quantities are the

- puddling process
- aston or Byers process

Steel

This is pure iron. Carbon content is more. Due to excessive carbon it is harder and tougher. Carbon content is from 0.15 to 1.5%. Besides there are other impurities like sulphur, phosphorous etc. are there which cannot be separated. This is hardened and tempered by heating it to a definite temperature and cooling it in oil or water.

The following methods are adopted for making different types of steel:

- 1 Cementation process
- 2 Crucible process
- 3 Bessemer process
- 4 Open hearth process
- 5 Electro thermo process
- 6 High frequency process.

Types of steel

Main two types of steel are:

- 1 Plain steel
- 2 Alloy steel

1 Plain steel. In this carbon and iron are mixed. According to the percentage of carbon plain steels are classified as:

- A Low carbon steel
- B Medium carbon steel
- C High carbon steel

A Low carbon steel: It is also called mild steel. In this, the percentage of carbon is from 0.15% to 0.25%. Due to less quantity of carbon is sufficiently soft and tolerates the strain. It can be put in different shapes through forging and rolling. This is not very hard or strong. This cannot be hardened or tempered by ordinary methods. Nuts, bolts, rivets, sheets, wires, T-iron and angle iron etc. are made out of it.

B Medium carbon steel: The carbon content is from 0.25% to 0.5%. Due to excess of carbon, it is harder and tougher than mild steel. The tenacity is more. This can be hardened or tempered. Various things are made by forging and rolling. This is used for making high tensile tubes, wires, agricultural implements, connecting rods, cam shafts, spanners, pulleys etc.

C High carbon steel: It has carbon content from 0.5% to 1.5%. It is very hard and wears least. This can be hardened by heat treatment. This can neither be cast nor rolled. This is very hard and tough. It acquires permanent magnetic properties. This is used for making pointed tools, springs, pumps, files, cutleries, cold chisels press die etc.

2 Alloy Steel

When the steel is mixed with other metals like vanadium, manganese tungsten etc., it is called an alloy steel. Alloy steel has properties of its ingredients.

Types of Alloy Steel

Two types of alloy steel are:

- A Low alloy steel
- B High alloy steel

A Low Alloy steel: Besides carbon other metals are in lesser quantity. Its tensile strength is more. The welding can work on it. This can also be hardened and tempered. It is used in manufacturing various parts of an aeroplane and cam shaft etc.

B High Alloy Steel: Besides carbon it has a high percentage of the metals higher than low steel alloy. This is classified into following types:

a High Speed Steel: It is also called high tungsten alloy steel because it has more quantity of tungsten. According to the quantity of tungsten it is classified into three types:

- 1 Tungsten 22%, Chromium 4%, Vanadium 1%
- 2 Tungsten 18%, Chromium 4%, Vanadium 1%
- 3 Tungsten 14%, Chromium 4%, Vanadium 1%

Cutting tools are made out of it because it is very hard but becomes soft at low critical temperature. This temperature is raised out of cutting process of tool, then the cutting tool becomes useless and is unfit for work. But due to high percentage of tungsten it keeps working upto high temperature. It is used for cutting tools, drills, cutters, reamers, hacksaw blades etc.

b Nickel Steel: In this 0.3% carbon and 0.25 to 0.35% nickel is present. Due to nickel its tensile strength, elastic limit and hardness is increased. It does not catch rust. Its cutting resistance increases 6 times more than plain carbon and steel due to 0.35% nickel present in it. This is used for making rivets, pipes, axle shafting, parts of buses and aeroplanes. If 5% of cobalt is mixed with 30-35% nickel, it becomes invar steel. It is mainly used for making precious instruments.

c Vanadium Steel: It contains 1.5% carbon 12.5% tungsten, 4.5% chromium, 5% vanadium and 5% cobalt. Its elastic limit, tensile strength and ductility is more. It has strength to bear sharp jerks. It is mainly used to manufacture of tools.

d Manganese Steel: It is also called special high alloy steel. It contains 1.6 to 1.9% of manganese

and 0.4 to 0.5% carbon. It is hard and less wear. It is not affected by magnet. It is used in grinders and rail points etc.

e Stainless Steel: Along with iron it contains 0.2 to 0.6% carbon, 12 to 18% chromium, 8% nickel and 2% molybdenum. It is used for making knives, scissors, utensils, parts of aeroplane, wires, pipes and gears etc.

Properties of stainless steel:

- 1 Higher corrosion resistance
- 2 Higher cryogenic toughness
- 3 Higher work hardening rate
- 4 Higher hot strength
- 5 Higher ductility
- 6 Higher strength and hardness
- 7 More attractive appearance
- 8 Lower maintenance

f Silicon Steel: It contains 14% of silicon. Its uses are multifarious according to the percentage of silicon. 0.5% to 1% silicon, 0.7 to 0.95% manganese mixture is used for construction work. 2.5 to 4% silicon content mixture is used for manufacturing electric motors, generators, laminations of transformers. In chemical industries 14% silicon content mixture is used.

g Cobalt Steel: High carbon steel contains 5 to 35% cobalt. Toughness and tenacity is high. It has magnetic property therefore used to make permanent magnets.

Mass, Weight, Volume and Density - Mass, volume, density, weight and specific gravity

Mass

Mass of a body is the quantity of matter contained in a body. The unit of mass in F.P.S system is pound (lb), in C.G.S. system gram (gr) and in M.K.S and S.I systems kilogram (kg). 1 ton which is 1000 kg is also used sometimes. The conversion factor is 1000. Three decimal places are shifted during conversion. E.g. 1 ton = 1000 kg 1g = 1000mg.

m - mass of a body

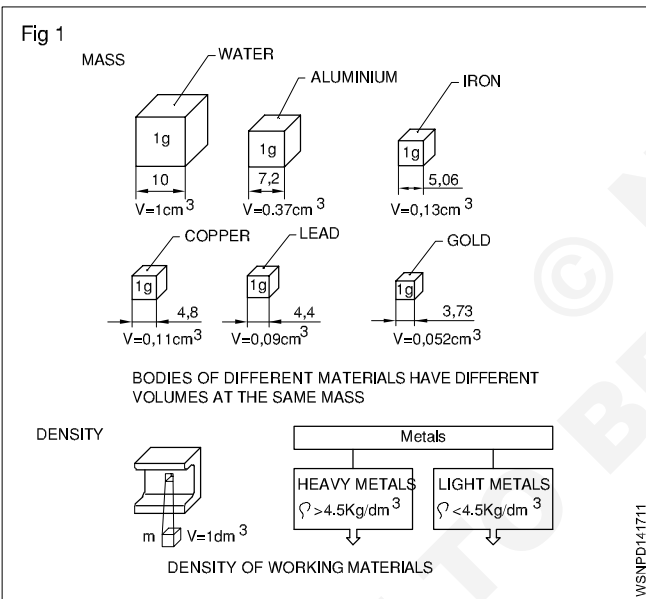

g - acceleration due to gravity in metre/sec² = 9.81 m/sec²

V - volume of the body

ρ - density (pronounced as 'rho')

W or FG - weight or weight force

Mass (Fig 1)

Density

Density is the mass of a body per unit volume. Hence its unit will be gr/cm³ or kg/dm³ or ton/m³.

$$\text{Density} = \frac{\text{mass}}{\text{volume}} = \frac{m}{v} = \rho$$

Weight (Fig 2)

Weight is the force with which a body is attracted by the earth towards its centre. It is the product of the mass of the body and the acceleration due to gravity. The weight of a body depends upon its location.

weight = W or FG = mass x gravitational force = m x g

System	Absolute unit	Derived unit	Conversion
F.P.S. system	1 poundal	1 Lb wt	32.2 poundals (1 lb x 1 ft/sec ² = 1 pound)
C.G.S. system	1 dyne	1 Gr.wt	981 dynes
M.K.S.	Newton	1 kg.wt	1 Newton =
S.I. system	Newton	Newton	1 kg x 1 m/sec ²

1 kg.wt = 9.81 Newton (approximately 10N) **1 Newton = 10⁵ dynes.**

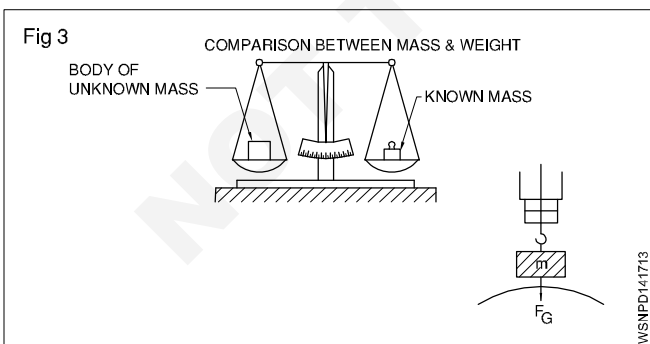

Difference between mass and weight

S. No	Mass	Weight
1	Mass is the quantity of matter in a body (ie) measurement of matter in a body	Weight is measure of amount of force acting on mass due to acceleration due to gravity
2	It does not depend on the position or space	It depends on the position, location and space
3	Mass of an object will not be zero	Weight of an object will be zero if gravity is absent
4	It is measured using by physical balance	It is measured using by spring balance
5	It is a scalar quantity	It is a vector quantity
6	When immersed in water mass does not change	When immersed in water weight will change
7	The unit is in grams and kilogram	The unit is in kilogram weight, a unit of force

Mass and weight are different quantities.
Mass of a body is equal to volume x density.
Weight force is equal to mass x acceleration due to gravity.

Weight , Density and Specific gravity

It is now seen that the mass of a substance is measured by its weight only without any reference to volume. But if equal weights of lead & aluminium, are compared the volume of lead is much smaller than volume of aluminium. So we can now say that lead is more dense than aluminium, .i.e In other words the density of lead is greater than aluminium. (Fig 3 & 4)

The relation of mass and volume is called density.

The density expresses the mass of volume E.g. 1 dm³ of water has the mass of 1kg - thus the density of 1kg/dm³ (Fig 2)

Unit

The density is measured as below

MKS/SI= Kg/m³, CGS = 1 gm/cm³ FPS = lbs/c ft

Solids	gm/cc	Liquids	gm/cc
1 Aluminium	2.7	Water	1.00
2 Lead	11.34	Petrol	0.71
3 Cast iron	6.8 to 7.8	Oxygen	1.43
4 Steel	7.75 to 8.05	Diesel Oil	0.83

The specific gravity of a substance is also called its relative density.

Formula

Specific gravity (or) Relative density = $\frac{\text{Density of the substance}}{\text{Density of the water at } 4^{\circ}\text{C}}$

= $\frac{\text{Mass of any volume of a substance}}{\text{Mass of an equal volume of water at } 4^{\circ}\text{C}}$

Comparison Between Density And Specific Gravity (Relative Density)

Density	Relative density or Specific gravity
Mass per unit volume of a substance is called its density Its unit is gm per cu cm; lbs per cu.ft and kg/cubic meter	The density of substance to density of water at 4°C is its relative density It has no unit of measurement simply expressed in a number
Density = $\frac{\text{Mass}}{\text{Volume}}$	Relative density = $\frac{\text{Density of the substance}}{\text{Density of water at } 4^{\circ}\text{C}}$

Solids	Sp.gy	Liquids	Sp.gy
1 Aluminium	2.72	Petrol	0.71
2 Lead	11.34	Battery acid	1.2 to 1.23
3 Cast iron	6.8 to 7.8	Water	1.00
4 Steel	7.82	Diesel Oil	0.83

From the above table, we can calculate the weight of any given volume of a substance (say Diesel oil) in any units provided we know the specific gravity of the substance. Also vice-versa for volume of density is known.

Mass, Weight, Volume and Density - Related problems for mass, volume, density, weight and specific gravity

- 1 Calculate the mass in kg of a rectangular steel plate of dimensions 220 x 330 x 15 mm (Fig 1) (density of steel = 7.82 gm/cm³)

$$\begin{aligned} \text{Mass} &= \text{Volume} \times \text{density} \\ &= 22 \times 33 \times 1.5 \text{cm} \times 7.82 \text{ gm/cm}^3 \\ &= 1089 \text{ cm}^3 \times 7.82 \text{ gm/cm}^3 \\ \text{mass} &= 8.516 \text{ kg} \end{aligned}$$

- 2 What is the weight in Newton if a storage container holds 250 litres of water and amount of water exert on the surface which it is standing? (Fig 2)

(1 litre of water = 1 kg of water)
 Density of water 1 gm/cm³ or 1 kg/dm³

Acceleration due to gravity is taken as 10 metre/sec² (approximation).

$$\begin{aligned} \text{Capacity} &= 250 \text{ litres} = 250 \text{ dm}^3 \text{ in volume.} \\ \text{Mass of water} &= \text{volume} \times \text{density of water} \\ &= 250 \text{ dm}^3 \times 1 \text{ kg/dm}^3 = 250 \text{ kg} \\ \text{Weight extended} &= \text{mass} \times \text{acceleration due to gravity} \\ &= 250 \text{ kg} \times 10 \text{ metre/sec}^2 \\ &= 2500 \text{ kg.metre/sec}^2 = 2500 \text{ N} (\because 1 \text{ kg.m/sec}^2 = 1 \text{ N}) \end{aligned}$$

- 3 A force of 15 dynes acting on a mass of 'm' produces an acceleration of 2.5 cm/sec². Find the mass.

$$1 \text{ Gr. wt.} = 981 \text{ dynes}$$

$$\therefore 15 \text{ dynes} = \frac{15}{981} \text{ Gr.wt}$$

Force = m x acceleration produced by the force

$$\therefore \text{Gr.wt} = \text{mass} \times 2.5 \text{ cm/sec}^2$$

$$\therefore \text{gr.cm/sec}^2 = \text{mass} \times 2.5 \text{ cm/sec}^2$$

$$\therefore \text{mass} = \frac{15}{981 \times 2.5} \text{ grams} = \frac{\text{gm.cm/sec}^2}{\text{cm/sec}^2}$$

$$\text{mass} = 0.00612 \text{ gram}$$

- 4 A force of 2 N acts on a mass of 10 kg. Find the acceleration produced by the force on the mass.

$$\text{Force} = 2 \text{ N} (\because 1 \text{ N} = 1 \text{ kg.m/sec}^2)$$

Force = mass x acceleration

$$\therefore 2 \text{ kg.metre/sec}^2 = 10 \text{ kg} \times \text{acceleration produced}$$

$$\therefore 2 \times 1 \text{ kg.metre/sec}^2 = 10 \text{ kg} \times \text{acceleration produced}$$

$$\therefore \text{acceleration produced} = \frac{2}{10} \text{ metre/sec}^2$$

$$= 0.2 \text{ metre/sec}^2$$

- 5 Calculate the weight of a body having a mass of 1 kg if the acceleration due to gravity is 9.81 metre/sec²

$$\begin{aligned} \text{Weight force} &= \text{mass} \times \text{acceleration due to gravity} \\ &= 1 \text{ kg} \times 9.81 \text{ metre/sec}^2 \end{aligned}$$

$$(1 \text{ kg.metre/sec}^2 = 1 \text{ N})$$

$$\therefore 9.81 \text{ kg metre/sec}^2 = 9.81 \text{ N}$$

In the examples solved the value of 'g' is taken as 10 metre/sec², unless specifically mentioned otherwise.

- The outside and inside diametres of a hollow sphere are 150 & 70mm respectively. Calculate its mass if the density of material is 7.5 gm/cm³. (Fig 3)

Mass = Volume x Density

$$= \text{Volume} \times 7.5 \text{ gm/cm}^3$$

$$D = 150 \text{ mm} = 15 \text{ cm} \quad R = 7.5 \text{ cm}$$

$$d = 70\text{mm} = 7\text{ cm} \quad r = 3.5\text{ cm}$$

$$\text{Volume} = \frac{4}{3}\pi(R^3 - r^3)\text{unit}^3$$

$$= \frac{4}{3}\pi(7.5^3 - 3.5^3)$$

$$= 1587.5\text{ cm}^3$$

$$\text{Mass} = 1587.5\text{ cm}^3 \times 7.5\text{ gm/cm}^3$$

$$= 11906.6\text{ gm} = 11.9\text{ kg} \quad \text{say } 12\text{ kg}$$

6 A car has a mass of 800 kg. Find out its weight force (Take 9.81 m/sec²)

$$(\because 1\text{ N} = 1\text{ kg}\cdot\text{m}/\text{sec}^2)$$

The Wt. force of a car = Mass of car x gravitational acceleration

$$= 800 \times 9.81\text{ N}$$

$$= 7848\text{ Newtons}$$

7 A cylindrical tank 2m dia x 3.5 m length is filled with petrol. Find the weight of petrol in Tonnes, Assume density of petrol 720 Kg/m³. (Fig 4)

Volume of Tank

$$v = \pi r^2 l \text{ (or)} \frac{\pi d^2}{4} \times l \text{ unit}^3 = \frac{\pi \times 2^2}{4} \times 3.5\text{ m}^3$$

$$3.14 \times 3.5\text{ m}^3 = 10.99\text{ m}^3$$

$$\text{Since } 1\text{ m}^3 = 1000\text{ litres}$$

$$\text{Volume of Tank} = 10.99 \times 1000\text{ litres}$$

$$\text{Density of petrol} = 720\text{ Kg/m}^3$$

$$\text{Weight of Petrol in Kg} = 10.99 \times 1000\text{ litres} \times 720\text{ Kg}$$

$$= 720 \times 10990\text{ Kg}$$

Weight of Petrol in Tonnes

$$\text{(Metric Units)} = \frac{720 \times 10990}{1000}$$

$$\text{Weight of Petrol} = 7912.8\text{ Tonnes}$$

8 If the battery acid specific gravity is 1.3, and this is being filled up into a cylindrical tank. Find out its density.

$$\text{(Density of water} = 1\text{ gm/cm}^3)$$

Specific gravity or Relative density

$$= \frac{\text{Density of the substance}}{\text{Density of water at } 4^\circ\text{C}}$$

Now, density of battery acid

$$= \text{Specific gravity} \times \text{Density of water}$$

$$= 1.3 \times 1\text{ gm/cm}^3$$

$$= 1.3\text{ gm/cm}^3$$

Determination of specific gravity of a substance

The specific gravity of a substance may be determined by

1 Archimedes Principle

2 Hydrometer

Archimedes Principle

Archimedes principle states that when a body is fully or partially immersed in a liquid, the amount of liquid displaced by the body is equal to the loss of weight of the body in the liquid.

Weight of a body in a liquid = total weight of the body

- weight of the liquid displaced by the body

This quantity if it is zero then the body will float. It is negative the body will rise up till the weight of liquid displaced by the immersed portion of the body is equal and equal to the weight of the body. If it is positive the body will sink. Specific gravity of solids soluble in water

$$= \frac{\text{weight of solid in air}}{\text{loss of weight of solid in water}}$$

specific gravity of solids soluble in water

$$= \frac{\text{weight of solid in air} \times \text{specific gravity of the liquid}}{\text{loss of weight of solid in which the solid is in solution}}$$

specific gravity of a liquid

$$= \frac{\text{loss weight of a solid in water}}{\text{loss of weight of the same solid in liquid}}$$

The solid chosen should be such that it is insoluble in both water and the liquid whose specific gravity is to be determined.

Example

1 An iron piece weighs 160 kgf in air and 133 kgf when it is fully immersed in water. Determine the volume and specific gravity of the iron piece.

$$\text{Weight of the solid in air} = 160\text{ kgf}$$

$$\text{Weight of the solid in water} = 133\text{ kgf}$$

$$\therefore \text{Loss of weight in water} = 27\text{ kgf}$$

By Archimedes principle the loss of weight of a solid in water = volume of water displaced.

$$\therefore \text{Volume of water displaced} = 27\text{ cm}^3$$

$$\therefore \text{Volume of the solid} = 27\text{ cm}^3$$

$$\text{Density of the iron piece} = \frac{\text{mass of iron}}{\text{volume of the piece}}$$

$$= \frac{160}{160 - 133} = \frac{160}{27} = 5.93$$

$$\text{Specific gravity} = \frac{\text{density of iron}}{\text{density of water}} = \frac{5.93}{1} = 5.93$$

Specific gravity of iron piece = 5.93

- 2 A metal piece weighs 6.5 kgf in air and 3.5 kgf in water. Find its weight when it is fully immersed in a liquid whose specific gravity is 0.8 and also the S.G of the metal.

Weight of metal piece in air = 6.5 kgf

Weight of metal piece in water = 3.5 kgf

∴ Loss of weight in water = 3.00 kgf (6.5 - 3.5)

∴ Specific gravity of metal

$$= \frac{\text{Weight of substance in air}}{\text{Loss of weight in water}} = \frac{6.5\text{kgf}}{3\text{kgf}} = 2.166$$

By applying the principle of Archimedes the above results are derived.

The weight of the metal piece in the liquid = W

∴ loss of weight of the metal in the liquid = 6.5 kgf - W

$$\text{Specific gravity of the liquid} = \frac{\text{loss of weight in liquid}}{\text{loss of weight of water}}$$

$$\therefore 0.8 = \frac{6.5\text{kgf} - W}{3\text{kgf}}$$

$$\therefore W = 6.5 \text{ kgf} - 3 \text{ kgf} \times 0.8 = 4.1 \text{ kgf}$$

∴ loss of weight of the metal in the liquid = 4.1 kgf.

By using a hydrometer, the specific gravity of a liquid is determined. The most common type of hydrometer is the Nicholson's hydrometer which is a variable weight but constant immersion type.

Specific gravity of a liquid

wt. of hydrometer+ wt. required to sink the hydrometer in the liquid to a fixed mark

wt. of hydrometer+ wt. required to sink the hydrometer in water up to the same mark

- 3 A piece of wood having 80cc volume, when floated on water remains 60cc volume above water. Find the weight of the water displaced.

Water displaced = Immersed volume

Immersed volume = volume of wood - volume of wood above water level

$$= 80 - 60 = 20\text{cm}^3$$

Weight of water displaced = volume x density of water

$$= 20 \times 1 = 20 \text{ grams}$$

Sl.No	Substance	Density gm/cc
1	Aluminium	2.7
2	Cast Iron	6.8 - 7.8
3	Copper	8.92
4	Gold	19.32
5	Iron	7.86
6	Lead	11.34

Workshop Calculation & Science - Electrician - Power Distribution Exercise 1.5.19

Speed and Velocity, Work, Power and Energy - Work, power, energy, HP, IHP, BHP and efficiency

Work (Fig 1)

Work is said to be done by a force, when it moves, its point of application through a distance. Applied force 'F' moves a body through a distance 's'.

Work done 'W' = F x s.

The S.I. unit of work is 1 joule which is the work done by a force of moving the body through a distance of 1 metre.

Therefore joule = 1 N x 1 metre = 1 Nm

Also 1 joule = 1 Nm = 10⁵ dynes x 100 cm = 10⁷ dynes cm = 10⁷ ergs.

F - force or weight force in N

s - distance the body on which force acts is moved in metres

t - time in seconds

v - speed in metre/sec

w - work done by the force in joules

P - Power in Watts

P_{out} - Power output

P_{in} - Power input

Force

A Force is that which changes or tends to change the state of rest or motion of a body.

Force = Mass x Acceleration

$$F = Ma$$

Unit

$$F = M \times a$$

$$= \text{kg} \times \text{m}/\text{sec}^2$$

$$= 1 \text{ Newton (SI unit)}$$

(Newton: If 1 kg of mass accelerates at the rate of 1m/sec² then the force exerted on the mass is 1 newton)

$$\text{FPS} = 1 \text{ pound} \times 1 \text{ Feet}/\text{second}^2$$

$$= 1 \text{ pound}$$

$$\text{CGS} = 1 \text{ gm} \times 1\text{cm}/\text{second}^2$$

$$= \text{Dyne}$$

$$\text{MKS} = 1 \text{ kg} \times 1\text{m}/\text{second}^2$$

$$= \text{Newton.}$$

$$1 \text{ Newton} = 10^5 \text{ dynes}$$

$$1\text{kg wt} = 9.81\text{N}$$

$$1 \text{ pound} = 4.448\text{N,}$$

$$\text{Newton} = 0.225 \text{ pound.}$$

Absolute units

In C.G.S. system unit of work = 1 erg = 1 dyne x 1 cm

In F.P.S system unit of work = 1 Foot poundal = 1 poundal x 1 foot

In M.K.S. system unit of work = 1 joule = 1 Newton x 1 metre

Derived units

C.G.S. system 1 gm Wt x 1 cm = 981 ergs.

F.P.S. system 1 ft lb = 981 foot poundal

M.K.S. system 1 kgf metre = 981 joule.

Power (Fig 2)

It is the work done in unit time.

$$\text{Power } P = \frac{\text{total work done}}{\text{total time}}$$

$$P = \frac{\text{Nm}}{\text{sec}}$$

$$\text{The S.I. units of power} = 1\text{Nm}/\text{sec} = \frac{1 \text{ joule}}{\text{sec}}$$

$$\text{which is} = 1 \text{ watt. power in watts} = \frac{w}{t} = \frac{F \cdot s}{t} = F \times V$$

which is equal to 1 Watt. Power in watts = w/t = F.s/t = F x V

In M.K.S. system the unit is 1 kgf meter/sec. One horse power is = 75 kg metre/sec or 4500 kgf metre/min.

1HP (metric) = 735.5 Watts

1HP (British) = 746 Watts = 0.746 KW

1 KW = 1.34 HP

Power input is the power given to a machine to do work. Power output is what we get out of the machine. Power output is always less than power input due to friction in the machine. The ratio between power output to power input is efficiency of the machine and it is expressed in percentage. (Fig 3)

$$\text{efficiency} = \frac{\text{power output}}{\text{power input}} \times 100\%$$

Indicated Horse Power and Brake Horse Power

The power actually generated by the engine or generator is the indicated horse power which is indicated on the plate.

The Brake horse power is the power available to do useful work. B.H.P. is always less than I.H.P. due to losses to overcome frictional resistance.

$$\therefore \text{mechanical efficiency} = \frac{\text{B.H.P}}{\text{I.H.P}} \times 100\%$$

Work done by a force = Magnitude of the force x distance moved by the body

Power = Total work done / total time taken

$$\text{efficiency} = \frac{\text{power output}}{\text{power input}} \times 100\%$$

Energy

The energy of a body is its capacity to do work. It is equal to power x time. Hence the unit of energy is the same as the unit of work in all systems.

Forms of energy

Mechanical energy, Electrical energy, Atomic energy, Heat energy, Light energy, Chemical energy, sound energy. Energy of one form can be transformed into energy of another form.

Law of conservation of energy

- The energy can neither be created nor destroyed.
- Total energy possessed by a body remains the same. (Fig 4)

Depending upon the position of the body or body in motion, mechanical energy possessed by the body may be potential energy or kinetic energy respectively.

Examples

- 1 A man weighting 75kg climb 200 metre high hill. Find the Work done by a man?

Formula: Work done (W) = F x S

Given data: F = 75 kg
S = 200m

To find: Work done (W) = ?

Solution: Work done (W) = F x S
= 75 x 200 = 15000

Ans: Work done (w) = 15000 kgm

- 2 Find the work required to lift a mass of 36.3 Newtons through a height of 3.7 metres?

Formula: Work done (W) = F x S

Given data: F = 36.3 N
S = 3.7m

To find: Work done (W) = ?

Solution: Work done (W) = F x S
= 36.3 x 3.7 N.m
= 134.31 Joules

Ans: Work done (W) = 134.31 Joules

- 3 Calculate the Work done by a man weighing 50kg in carrying a mass of 20kg over his head when he covers a distance of 15metres in vertical direction.

Formula: Work done (W) = F x S

Given data: F = 50kg + 20kg = 70kg
S = 15 m

To find: Work done (W) = ?

Solution: Work done (W) = F x S
= 70 x 15 = 1050

Ans: Work done (W) = 1050 kg.m

- 4 A man weighing 60kg lifts a weight of 40kg to the top of building 12 metres height. Find the useful Work done by him and also the efficiency?

Formula: Work done (W) = F x S

Given data: Man weight = 60kg
Lifts a weight = 40kg
Total weight = 60 + 40 = 100kg
Distance (S) = 12 m

To find: a) Work done (W) = ?
b) Efficiency (η) = ?

Solution:

a) Work done (W) = F x S
= 100 x 12 = 1200 kg.m

b) Efficiency (η) = $\frac{\text{Output}}{\text{Input}} \times 100\%$
= $\frac{40 \times 12}{60 \times 12} \times 100\%$
= $\frac{480}{720} \times 100\%$
= 66.67%

Ans: a) Work done (W) = 1200 kg.m

b) Efficiency (η) = 66.67%

- 5 A pump pumps 4000kg of water from 50 metres depth in 40 minutes. Find the Work done by pump in one second?

Formula: Work done (W) = F x S

Given data: F = 4000 kg
S = 50 m

To find: Work done per second = ?

Solution:

Work done in 40 minutes,
Work done (W) = F x S
= 4000 x 50 = 200000 kgm
= $\frac{200000}{40} = 5000$

Work done in 1 second = $\frac{5000}{60} = 83.3$

Ans: Work done in 1 second (W) = 83.33 kg.m

- 6 A body of 225 kg is moved by 300 metres in 90 seconds. Find the power required to lift this body?

Formula: Power (P) = $\frac{F \times S}{t}$

Given data: F = 225 kg
S = 300m
t = 90 sec

To find: Power (P) = ?

Solution: Power (P) = $\frac{F \times S}{t}$
= $\frac{225 \times 300}{90}$ kg.m/sec
= 750 kg.m/sec

Ans: Power (P) = 750 kg.m/sec

- 7 A hydraulic press lifts a load of 5 tonnes in 5 minutes to a height of 5 metres. Calculate the power of the press?

Formula: Power (P) = $\frac{F \times S}{t}$

Given data: F = 5 tonnes = 5000 kg
S = 5 metres
t = 5 minutes = 5 x 60 = 300 sec

To find: Power (P) = ?

Solution: Power (P) = $\frac{F \times S}{t}$
= $\frac{5000 \times 5}{300} = 83.33$

Ans: Power (P) = 83.33 kg.m/sec

- 8 A machine weighing 750N takes 25N material to a height of 10 metres in one minute. calculate the power of machine?

Formula: Power (P) = $\frac{F \times S}{t}$

Given data:

Machine weight = 750N
Material weight = 25N
F = 750 + 25 = 775N
S = 10 m
t = 1 min = 60 sec

To find: Power (P) = ?

Solution: Power (P) = $\frac{F \times S}{t}$
= $\frac{775 \times 10}{60} = 129.17\text{N m/sec}$

Ans: Power (P) = 129.17N m/sec (or) watts

- 9 What is the power of pump which takes 15 seconds to lift 90kg of water to a tank situated at a height of 30 metres. (Take $g = 10\text{m/sec}^2$)?

Formula: Power (P) = $\frac{FxS}{t}$

Given data: F = 90 kg
S = 30 m
t = 15 sec

To find: Power (P) = ?

Solution: Power (P) = $\frac{FxS}{t}$

$$= \frac{f \times g \times s}{t}$$

$$= \frac{90 \times 10 \times 30}{15}$$

$$= 1800 \text{ Nm/sec} \quad \therefore (1 \text{ Nm/sec} = 1 \text{ watt})$$

Ans: Power (P) = 1800 watts

- 10 A hoist lifts a weight of 1000kg through a height of 33 metres in one minute. Find out the horsepower of the hoist?

Formula: Horsepower HP = $\frac{FxS}{t} \times \frac{1}{75}$

Given data: F = 1000 kg
S = 33 m
t = 1 minute = 60 sec

To find: Horsepower HP = ?

Solution: Horsepower HP = $\frac{FxS}{t} \times \frac{1}{75}$

($\therefore 75 \text{ kg.m/sec} = 1 \text{ HP}$)

$$= \frac{1000 \times 33}{60} \times \frac{1}{75}$$

$$= 7.33 \text{ H.P.}$$

Ans: Horsepower, HP = 7.33 H.P.

- 11 A pump can raise 900 litres of water per minute to a height of 45 metres. Calculate the H.P of pump?

Formula: Horsepower HP = $\frac{FxS}{t} \times \frac{1}{75}$

Given data: F = 900 litres = 900 kg
S = 45 m
t = 1 minute = 60 sec

To find: Horsepower HP = ?

Solution: Horsepower HP = $\frac{FxS}{t} \times \frac{1}{75}$

($\therefore 1 \text{ HP} = 75 \text{ kg.m/sec}$)

$$= \frac{900 \times 45}{60} \times \frac{1}{75} = 9 \text{ H.P}$$

Ans: Horsepower, HP = 9 H.P.

- 12 Find the horsepower of an engine to lift a weight of 2 tonnes to a height of 30 metres in two minutes?

Formula: Horsepower HP = $\frac{FxS}{t} \times \frac{1}{75}$

Given data: F = 2 tonnes = 2000 kg
S = 30 m
t = 2 minutes = 120 sec

To find: Horsepower HP = ?

Solution: Horsepower HP = $\frac{FxS}{t} \times \frac{1}{75}$

($\therefore 1 \text{ HP} = 75 \text{ kg.m/sec}$)

$$= \frac{2000 \times 30}{120} \times \frac{1}{75} = 6.67 \text{ H.P.}$$

Ans: Horsepower, HP = 6.67 H.P.

- 13 Find out horsepower of a pump required to lift 10000 litres of water in 3 minutes at height of 16 metres. Assume efficiency of pump as 94%?

Formula: Horsepower HP = $\frac{FxS}{t} \times \frac{1}{75}$

$$\eta = \frac{\text{Output}}{\text{Input}} \times 100\%$$

Given data: F = 10000 litres = 10000 kg
S = 16 metres
t = 3 minute = 180 sec

To find: Horsepower HP = ?

Solution: Horsepower HP = $\frac{FxS}{t} \times \frac{1}{75}$

($\therefore 1 \text{ HP} = 75 \text{ kg.m/sec}$)

$$= \frac{10000 \times 16}{180} \times \frac{1}{75}$$

$$= 11.85 \text{ H.P.}$$

$$\eta = \frac{\text{Output}}{\text{Input}} \times 100\%$$

$$94 = \frac{11.85}{\text{Input}} \times 100$$

$$\text{Input} = \frac{11.85 \times 100}{94} = \frac{1185}{94}$$

$$= 12.606 \text{ H.P.}$$

Ans: Input H.P of Pump = 12.606 H.P.

14 Find the horsepower of a motor which is required to lift 500 tonnes of coal per hour from a mine of 320 metre depth. Efficiency of motor is 0.75?

Formula: $\eta = \frac{\text{Output}}{\text{Input}} \times 100\%$

$$\text{Output H.P} = \frac{F \times S}{t} \times \frac{1}{75}$$

Given data:

F = 500 tonnes = 500000 kg

S = 320 metres

t = 1 hour = 3600 sec

$\eta = 0.75 = 75\%$

To find: Pump HP = ?

Solution:

$$\text{Output HP} = \frac{F \times S}{t} \times \frac{1}{75}$$

(\because 1 HP = 75 kg.m/sec)

$$= \frac{500000 \times 320}{3600} \times \frac{1}{75}$$

$$= 592.59 \text{ H.P.}$$

$$\eta = \frac{\text{Output}}{\text{Input}} \times 100\%$$

$$75 = \frac{592.59 \times 100}{\text{Input}}$$

$$\text{Input} = \frac{59259}{75}$$

Ans: Input = 790.12 H.P

15 A train weighing 25 tonnes is moving at a speed of 90km/hour. Find the horsepower of the engine, if the frictional force is 5kg per tonnes?

Formula: Horsepower HP = $\frac{F \times S}{t} \times \frac{1}{75}$

Given data: Train speed = 90 km/hour

$$= 90 \times \frac{1000}{3600} = 25 \text{ m/sec}$$

Train weight = 25 tonnes

Frictional force per tonnes = 5 kg

25 tonnes frictional force

(F) = 25 x 5 = 125kg

To find: Horsepower of the engine = ?

Solution: $\text{HP} = \frac{F \times S}{t} \times \frac{1}{75}$

$$= \frac{125 \times 25}{1} \times \frac{1}{75}$$

Ans: HP = 41.67 H.P.

16 A pump delivers 9000 litres of water per minute to a height of 14 metres. The efficiency of the pump is 78%. The efficiency of electric motor which drives the pump is 92%. Find out the input of the motor?

Formula: $\eta = \frac{\text{Output}}{\text{Input}} \times 100\%$

$$\text{Output H.P} = \frac{F \times S}{t} \times \frac{1}{75}$$

1 H.P = 0.7355 KW (metric)

Given data:

F = 9000 litres = 9000 kg

S = 14 metres

t = 1 minute = 60 sec

pump $\eta = 75\%$

motor $\eta = 92\%$

To find: Electric motor (KW) = ?

Solution:

$$\text{Pump Output HP} = \frac{F \times S}{t} \times \frac{1}{75}$$

$$= \frac{9000 \times 14}{60} \times \frac{1}{75}$$

$$= 28 \text{ H.P.}$$

Input of the pump

$$\eta = \frac{\text{Output}}{\text{Input}} \times 100\%$$

$$78 = \frac{28}{\text{Input}} \times 100$$

$$\text{Input} = \frac{28 \times 100}{78} = 35.9 \text{ H.P}$$

Output of the motor = Input of the pump

$$\text{Output} = 35.9 \text{ H.P}$$

Input of the motor

$$\text{Motor } \eta = \frac{\text{Output}}{\text{Input}} \times 100\%$$

$$92 = \frac{35.9}{\text{Input}} \times 100$$

$$\text{Input} = \frac{35.9 \times 100}{92} = 39.02 \text{ H.P}$$

Ans: Motor input = 39.02 H.P

17 I.H.P of generator is 6 H.P and its efficiency is 90%.
Find tis B.H.P.

Formula: $\eta = \frac{\text{B.H.P}}{\text{I.H.P}} \times 100\%$

Given data:

I.H.P = 6 H.P
 $\eta = 90\%$

To find: B.H.P = ?

Solution: $\eta = \frac{\text{B.H.P}}{\text{I.H.P}} \times 100\%$

$90 = \frac{\text{B.H.P}}{6} \times 100\%$

$\frac{90 \times 6}{100} = \text{B.H.P}$

B.H.P = 5.4 H.P

Ans: B.H.P of generator = 5.4 H.P

18 A machine is working on 80% efficiency I.H.P of machine is 50. Calculate the power lost in friction.

Formula: I.H.P = B.H.P + Frictional losses

$\eta = \frac{\text{B.H.P}}{\text{I.H.P}} \times 100\%$

Given data: Efficiency $\eta = 80\%$

I.H.P = 50

To find: Friction = ?

Solution: $\eta = \frac{\text{B.H.P}}{\text{I.H.P}} \times 100\%$

$80 = \frac{\text{B.H.P}}{\text{I.H.P}} \times 100\%$

$80 = \frac{\text{B.H.P}}{50} \times 100\%$

$\frac{80 \times 50}{100} = \text{B.H.P}$

B.H.P = 40

B.H.P = I.H.P - F.H.P

40 = 50 - F.H.P

40 + F.H.P = 50

F.H.P = 50 - 40 = 10

Ans: Loss of friction = 10 H.P

Assignment

1

$m = 55 \text{ kg}$

a) $s = 1.82 \text{ metres}$
 $W = \text{_____ joules}$

b) $s = 1.40 \text{ metres}$
 $W = \text{_____ joules}$

c) $s = 0.85 \text{ metres}$

$W = \text{Joules}$

4

$m = 75 \text{ kg}$

$s = 100 \text{ metres}$

$t = 12 \text{ secs}$

$W = \text{_____ N}$

$P = \text{_____ Watts}$

2

$t = 8 \text{ secs}$

a) $P = \text{_____ Watts}$

b) $P = \text{_____ Watts}$

c) $P = \text{_____ Watts}$

(*W of a,b,c of Q1)

5

$V = 1 \text{ m}^3/\text{min}$

$H = 2 \text{ m}$

$\eta = 0.75$

Power input = _____ kW

3

$W = 1312.5 \text{ Joules}$

$m = 350 \text{ kg}$

$s = \text{_____ metres}$

6

$P = 12 \text{ kw}$

$s = 4 \text{ metres}$

$t = 20 \text{ secs}$

$m = \text{_____ kg}$

Workshop Calculation & Science - Electrician - Power Distribution Exercise 1.5.20

Speed and Velocity, Work, Power and Energy - Potential energy, kinetic energy and related problems with assignments

Potential energy

Potential energy is the energy possessed by a body by virtue of its position. A body of mass 'm' kept at a height 'h' from a datum possesses a potential energy of mgh or Wh or Fh; where W or F are the Weight force. When the body is allowed to fall it will be able to do a useful work of Fh.

Example

- Water stored in a Tank
- Coil Spring.

Kinetic energy

It is the energy possessed by a body by virtue of its motion. If a body of mass 'm' starting from rest attains a velocity of 'v' after covering a distance of 's', by the action of an applied force 'F', then work done on the body = F x s. But F = m x a. Therefore work done on the body = m x a x s.

But a x s = $\frac{V^2}{2}$ because the body is starting from rest.

Therefore Work done on the body = $\frac{1}{2}mv^2$.

Since work done on the body = The energy possessed by the body

Kinetic Energy = $\frac{1}{2}mv^2$.

Energy possessed by a body = work done on the body

Potential energy = mgh

Kinetic energy = $\frac{1}{2}mv^2$

If friction is neglected potential energy = Kinetic energy

Example

- Rolling vehicle
- Rotating fly wheel
- Flowing water
- Falling weight

Potential energy

Hammer head drops from height 'h'. m = 10 kg. What is the P.E and K.E?

h = 1.4 m.

u = 0 $\frac{\text{metre}}{\text{sec}}$

V² = 2 gs

V² = 2 x 9.81 x 1.4

V² = 27.468

V = 5.24 m/sec

P.E = 10 kg x 9.81 metre/sec² x 1.4 metre (Fig 1)

= 137.3 N metre ($\because 1N = 1kg.m/sec^2$)

K.E = $\frac{1}{2} \times 10 \text{ kg} \times 5.24^2 \frac{\text{metre}^2}{\text{sec}^2}$

= 137.3 N metre.

Examples

- A pulley is used to lift a mass with a force of 900 N to a height of 10 metres in 2 minutes. Find the work done by the force and also the power.(Fig 2)

Work done = F x s = 900N x 10 metre

= 9000 Nm = 9000 joules.

Power = $\frac{W}{t} = \frac{9000 \text{ joules}}{120\text{sec}}$

= $\frac{75 \text{ joules}}{\text{sec}}$

= 75 watts

- Determine the horse power required to drive a lift in raising a load of 2000 kgf at a speed of 2 metre/sec, if the efficiency is 70%.

Useful Work done to raise the lift in 1 sec

Force = 2000 kgf

Work = F x d

$$\text{Power} = \frac{F \times d}{t} = \frac{2000 \times 2}{1} = 4000 \text{ w}$$

$$\text{Power output} = 4000 \text{ w}$$

$$\text{Power input} = \text{Power output}$$

$$= \frac{4000}{0.7} = 5714 \text{ w}$$

$$\eta = \frac{\text{Output}}{\text{Input}} \times 100\%$$

$$\text{HP} = \frac{5714}{746} = 7.659 \approx 7.6 \text{ HP}$$

$$\text{Power input} = 7.6 \text{ HP}$$

- A mass of 100 gm is allowed to fall from a height of 10 metres. Determine the amount of Kinetic energy gained by the body. (Take the value of g as 10 metre/sec²)

Since initial velocity is 0 and distance travelled is 10 metres. final velocity²

$$= V^2 = 2 \times g \times s = 2 \times 10 \times 10 \text{ metre}^2/\text{sec}^2$$

$$\therefore \text{K.E} = \frac{1}{2} mv^2 = \frac{1}{2} \times 100 \text{ gm} \times 200 \text{ metres}^2/\text{sec}^2$$

$$= 10000 \text{ gm metre}^2/\text{sec}^2$$

$$= 10 \times 10^7 \text{ ergs}$$

$$= 10 \text{ Joules.}$$

K.E. developed by the vehicle at a constant speed

- A motor vehicle of one tonne is travelling at 60 km/hr. Calculate K.E of the vehicle at this speed.

$$\text{K.E of the vehicle} = \frac{1}{2} mv^2$$

Where m = one tonne or 1000 kg

$$v = 60 \text{ km/hr}$$

Solution

Changing v into meter/sec we get,

$$V = 60 \times \frac{1000}{60 \times 60} = \frac{50}{3} \text{ m/sec} \quad (\because 1 \text{ km} = 1000 \text{ m})$$

$$(\because 1 \text{ hour} = 3600 \text{ sec})$$

$$\text{Now K.E. of vehicle} = \frac{1}{2} \times 1000 \times \frac{50}{3} \times \frac{50}{3}$$

$$= 1000 \times \frac{2500}{18}$$

$$= \frac{2500000}{18} \text{ J}$$

$$= \frac{2500000}{1000 \times 18} \text{ KJ}$$

$$= \frac{1250}{9} \text{ KJ}$$

$$= 138.89 \text{ KJ}$$

K.E. developed by a vehicle during acceleration

- A motor vehicle of 1200 Kg mass is being accelerated from 36 km to 48 km/hr speed. Calculate the increase in K.E during its acceleration.

Solution

Mass of motor vehicle = 1200 kg

K.E. of the vehicle at 36 km/hr speed

$$= \frac{1}{2} \times 1200 \times 36^2 \text{ J} \quad \text{KE} = \frac{1}{2} mv^2 \text{ J}$$

$$v = 36 \text{ km/hr} = 36 \times \frac{1000}{60 \times 60} = 10 \text{ m/sec}$$

K.E of the vehicle at 48 km/hr speed

$$= \frac{1}{2} \times 1200 \times 48^2 \text{ J} \quad (\because 1 \text{ kg.m/sec}^2 = 1 \text{ N})$$

$$(\because 1 \text{ Nm} = 1 \text{ J})$$

$$v = 48 \text{ km/hr} = 48 \times \frac{1000}{60 \times 60} = \frac{40}{3} \text{ m/sec}$$

$$\text{KE} = \frac{1}{2} \times 1200 \times 10 \times 10 = 60000 \text{ J}$$

$$\text{KE} = \frac{1}{2} \times 1200 \times \frac{40}{3} \times \frac{40}{3} = 106666.67 \text{ J}$$

$$\begin{aligned} \text{Increase in K.E of the vehicle} &= 106666.67 \text{ J} - 60000 \text{ J} \\ &= 46666.67 \text{ J} \\ &= 46.666 \text{ KJ.} \end{aligned}$$

Work done in vehicle operation

The Mechanical Work performed by the motor vehicle for its propulsion on road can generally be classified into two major categories of work done.

- Work done by the IC engine in developing full power under all condition of speed and load.
- Work done by the motor vehicle in performing different operations on road like hill climbing/acceleration/braking/towing and reversing operation.

Assignment

- 1 What is the potential energy in a body of mass 5 kg on top of a pole 20 metre high?
- 2 What is the kinetic energy of a mass of 1 kg moving with velocity if 150 cm/sec?
- 3 The mass of a body is 4×10^3 kg and it is moving with a velocity 0.1 m/sec. Find out the kinetic energy and mention the unit?
- 4 A bullet of mass 4 grams moves with a speed of 400 m/sec. Calculate the kinetic energy of the bullet and the force required to stop the bullet in 20 cm of distance?
- 5 A bullet of mass 5 grams travel with a speed of 500 m/sec/ If it penetrates a fixed target which offers a constant resistance of 1000N to the motion of the bullet. Find kinetic energy.
- 6 3 kg of mass is Thrown horizontally and attains the speed of 10 metre per second. Find its kinetic energy.
- 7 The engine of a vehicle 1200 kg moving at 50 km per hour is switched off. calculate the kinetic energy of the vehicle and the distance moved against a resistance of 400 Newton's before coming to stop.
- 8 What is the kinetic energy of mass 3 kg moving with a velocity of 18 km/hour.
- 9 An Iron ball of mass 5 kg is raised to height of 4 metres. If the acceleration due to gravity is 9.8 m/sec^2 . Calculate the potential energy?
- 10 A total of 4900 joules was expended in lifting a mass of 50 kg. Find the height by which mass was lifted.
- 11 A mass of 5 kg is placed at the height of 30m from the ground. Find the potential energy of the mass in joules.

Heat & Temperature and Pressure - Concept of heat and temperature, effects of heat, difference between heat and temperature, boiling point & melting point of different metals and non-metals

Heat

It is a form of energy. Heat energy can be transformed into other forms of energies. Heat flows from a hotter body to a colder body. (Fig 1)

Units of heat

Calorie: It is the quantity of heat required to raise the temperature of 1 gram of water through 1°C.

BTHU: It is the quantity of heat required to raise 1 lb of water through 1°F. (British thermal unit).

C.H.U; It is the quantity of heat required to raise 1 lb of water through 1°C.

Joule : S.I. Unit (1 Calorie = 4.186 joule)

Effects of heat

- Change in temperature
- Change in size
- Change in state
- Change in structure
- Change in Physical properties

Specific heat

The quantity of heat required to raise the temperature of one gm of a substance through 1°C is called specific heat. It is denoted by the letter 's'.

Specific heat of water	= 1
Aluminium	= 0.22
Copper	= 0.1
Iron	= 0.12

Thermal capacity:

It is the amount of heat required to raise the temperature of a substance through 1°C is called the thermal capacity of the substance.

Thermal capacity = ms calories.

Calorific value: The amount of heat released by the complete combustion of unit quantity of the fuel (Mass or volume) is known as calorific value of fuels.

Water equivalent

It is the mass of water which will absorb the same amount of heat as the given substance for the same temperature rise. Water equivalent = Mass of the substance x specific heat of the substance.

Therefore water equivalent = ms

Types of heat

- 1 Sensible heat
- 2 Latent heat

1 Sensible heat

Sensible heat is the heat absorbed or given off by a substance without changing its physical state. It is sensible and can be absorbed by the variation of temperature in the thermometers.

2 Latent heat

The heat gained or given by the substance during a change of state (from solid to liquid to gas) is called latent heat or hidden heat. The heat absorbed or given off does not cause any temperature change in the substance.

Types, 1. Latent heat of fusion of solid

2. Latent heat of vaporisation of solid.

1 Latent heat of fusion of solid

The amount of heat required per unit mass of a substance at melting point to convert it from the solid to the liquid state is called latent heat of fusion of solid. Its unit is cal/gram.

Latent heat of fusion of ice

The amount of heat required to convert per unit mass of the ice into water at 0°C temperature is called latent heat of fusion of ice.

Latent heat of fusion of ice(L) = 80 cal/gram

2 Latent heat of vaporisation of liquid

The amount of heat required to vaporise a unit mass of liquid at its boiling point is called latent heat of vaporisation.

Latent heat of vaporisation of water or latent heat of steam

The amount of heat required to convert into steam of a unit mass of water at its boiling point (100°C) is called latent heat of vaporisation of water or latent heat of steam.

Latent heat of steam(L) = 540 cal/gram

Temperature

It is the degree of hotness or coldness of a body. The temperature is measured by thermometers.

Difference between heat and temperature

Heat	Temperature
1 It is a form of energy.	This tells the state of heat.
2 Its unit is calorie.	Its unit is degree.
3 Heat is measured by calorimeter.	Temperature is measured by thermometer.
4 By adding quantity of heat of two substances their total heat can be calculated.	By adding two temperatures we cannot find the temperature of the mixture.
5 By heating a substance the quantity of heat is increased regardless of increase in temperature.	Two substances may read the same temperature though they might be having different amount of heat in them.

Boiling point

Any substance starts turning into a gas shows the temperature at which it boils this is known as the boiling point. The boiling point of water is 100°C.

Melting point

The temperature at which any solid melts into liquid or liquid freezing to solid is called the melting point of substance. The melting point of ice is 0°C.

List of melting point and boiling point of metals and Non -metals

Metals and Non-metals	Melting point °C	Boiling point °C	Metals and Non-metals	Melting point °C	Boiling point °C
Aluminium	660.25	2519	Manganese	1246	2061
Argon	-189.19	-185.85	Mercury	-38.72	357
Arsenic	817	614	Molybdenum	2617	4639
Barium	729	1897	Nickel	1453	2913
Beryllium	1287	2469	Nitrogen	-209.86	-195.79
Bromine	-7.1	58.8	Oxygen	-226.65	-182.95
Cadmium	321.18	767	Phosphorus (white)	44.1	280
Calcium	839	1484	Plutonium	640	3228
Carbon (diamond)	3550	4827	Potassium	63.35	759
Carbon (graphite)	3675	4027	Radium	700	1737
Chlorine	-100.84	-34.04	Silicon	1410	3265
Cobalt	1495	2927	Silver	961	2162
Copper	1084.6	2562	Sodium	98	883
Gold	1064.58	2856	Sulfur	115.36	444.6
Helium	-	-268.93	Tin	232.06	2602
Hydrogen	-259.98	-252.87	Titanium	1660	3287
Iodine	113.5	184.3	Tungsten (wolfram)	3422	5555

Magnesium	650	1090			

Heat & Temperature and Pressure - Scales of temperature, celsius, fahrenheit, kelvin and conversion between scales of temperature

Temperature Scales

Temperature is calibrated between two fixed reference points namely the freezing point of water, and the boiling point of water. These two fixed points on different temperature scales are:

Scale	Freezing point	Boiling point
Centigrade (°C)	0°C	100°C
Fahrenheit (°F)	32°F	212°F
Kelvin (K)	273°K	373°K
Reaumur (°R)	0°R	80°R

Heat is a form of energy. Temperature is the degree of hotness or coldness of a body. The relationship for conversion from one temperature scale to the others is

$$\frac{^{\circ}\text{R}}{80} = \frac{^{\circ}\text{C}}{100} = \frac{^{\circ}\text{K} - 273}{100} = \frac{^{\circ}\text{F} - 32}{180}$$

1 Convert 0°C into °F

$$\frac{^{\circ}\text{F} - 32}{180} = \frac{^{\circ}\text{C}}{100}$$

$$^{\circ}\text{F} - 32 = \frac{^{\circ}\text{C}}{100} \times 180$$

$$^{\circ}\text{F} - 32 = \frac{0}{100} \times 180$$

$$^{\circ}\text{F} = 0 + 32$$

$$= 32^{\circ}\text{F}$$

0°C = 32°F

2 Convert -40°C into °F

$$\frac{^{\circ}\text{F} - 32}{180} = \frac{^{\circ}\text{C}}{100}$$

$$^{\circ}\text{F} - 32 = \frac{^{\circ}\text{C}}{100} \times 180$$

$$^{\circ}\text{F} - 32 = \frac{-40}{100} \times 180$$

$$\text{F} - 32 = -72$$

$$^{\circ}\text{F} = -72 + 32$$

$$= -40^{\circ}\text{F}$$

-40°C = -40°F

3 Convert 37°C into K

$$\frac{^{\circ}\text{C}}{100} = \frac{^{\circ}\text{K} - 273}{100}$$

$$^{\circ}\text{K} - 273 = \text{C}$$

$$^{\circ}\text{K} = \text{C} + 273$$

$$^{\circ}\text{K} = 37 + 273$$

$$= 310 \text{ K}$$

37°C = 310K

4 Convert 70°C into Reaumur

$$\frac{^{\circ}\text{C}}{100} = \frac{^{\circ}\text{R}}{80}$$

$$^{\circ}\text{R} = \frac{\text{C}}{100} \times 80$$

$$^{\circ}\text{R} = \frac{70}{100} \times 80 = 56$$

70°C = 56°R

5 Convert -25°F into $^{\circ}\text{C}$

$$\frac{^{\circ}\text{C}}{100} = \frac{^{\circ}\text{F} - 32}{180}$$

$$\frac{^{\circ}\text{C}}{100} = \frac{-25 - 32}{180}$$

$$^{\circ}\text{C} = \frac{-57}{180} \times 100$$

$$^{\circ}\text{C} = \frac{-285}{9} = -31.66$$

$$-25^{\circ}\text{F} = -31.7^{\circ}\text{C}$$

6 Convert 98.6°F into $^{\circ}\text{C}$

$$^{\circ}\text{C} = \frac{^{\circ}\text{F} - 32}{180} \times 100$$

$$^{\circ}\text{C} = \frac{98.6 - 32}{180} \times 100$$

$$= \frac{66.6}{180} \times 100$$

$$= \frac{6660}{180} = 37^{\circ}\text{C}$$

$$98.6^{\circ}\text{F} = 37^{\circ}\text{C}$$

Assignment

Convert the following

1 $10.5^{\circ}\text{C} = \underline{\quad}^{\circ}\text{F}$

2 $40^{\circ}\text{C} = \underline{\quad}^{\circ}\text{F}$

3 $60^{\circ}\text{C} = \underline{\quad}^{\circ}\text{F}$

4 $80^{\circ}\text{C} = \underline{\quad}^{\circ}\text{F}$

5 $105^{\circ}\text{C} = \underline{\quad}^{\circ}\text{F}$

6 $100^{\circ}\text{C} = \underline{\quad}^{\circ}\text{F}$

7 $-80^{\circ}\text{C} = \underline{\quad}^{\circ}\text{F}$

8 $200^{\circ}\text{C} = \underline{\quad}^{\circ}\text{F}$

9 $605^{\circ}\text{C} = \underline{\quad}^{\circ}\text{F}$

10 $1250^{\circ}\text{C} = \underline{\quad}^{\circ}\text{F}$

11 $77^{\circ}\text{F} = \underline{\quad}^{\circ}\text{C}$

12 $20^{\circ}\text{F} = \underline{\quad}^{\circ}\text{C}$

13 $428^{\circ}\text{F} = \underline{\quad}^{\circ}\text{C}$

14 $-210^{\circ}\text{F} = \underline{\quad}^{\circ}\text{C}$

15 $88^{\circ}\text{F} = \underline{\quad}^{\circ}\text{C}$

16 $110^{\circ}\text{F} = \underline{\quad}^{\circ}\text{C}$

17 $72^{\circ}\text{F} = \underline{\quad}^{\circ}\text{C}$

18 $50^{\circ}\text{F} = \underline{\quad}^{\circ}\text{C}$

19 $900^{\circ}\text{F} = \underline{\quad}^{\circ}\text{C}$

20 $72^{\circ}\text{R} = \underline{\quad}^{\circ}\text{C}$

21 $143^{\circ}\text{C} = \underline{\quad}\text{K}$

22 $373^{\circ}\text{K} = \underline{\quad}^{\circ}\text{C}$

23 $746^{\circ}\text{K} = \underline{\quad}^{\circ}\text{F}$

24 At what temperature will the reading of a fahrenheit thermometer be double of a centigrade one.

Heat & Temperature and Pressure - Temperature measuring instruments, types of thermometer, pyrometer and transmission of heat - Conduction, convection and radiation

Measuring heat energy

Energy can be released in chemical reactions as light, sound or electrical energy. But it is most often released as heat energy. This allows us to easily measure the amount of heat energy transferred.

The apparatus used to measure the amount of heat by mixer method is called calorimeter. It is nothing but cylindrical shaped vessel and a stirrer made out of mostly copper.

In a calorimeter when the hotter solid/liquid substance are mixed with the cooler solid/liquid substances, heat transfer takes place until both substances reach the same temperature. By the same time calorimeter also reaches the same temperature. By mixing rule,

$$\left[\begin{array}{l} \text{Loss of heat} \\ \text{by solid/} \\ \text{liquid} \end{array} \right] = \left[\begin{array}{l} \text{Heat absorbed by} \\ \text{solid / liquid} \\ \text{substance} \end{array} \right] + \left[\begin{array}{l} \text{Heat absorbed} \\ \text{by calorimeter} \end{array} \right]$$

Measurement

Temperature is generally measured in degrees Celsius. In this system the freezing point of water is defined as 0°C and the boiling point of water is defined as 100°C. The Kelvin temperature scale begins from absolute 0. i.e. 273°. The temperature intervals are the same.

$$\therefore 273K = 0^\circ C, 20^\circ C = 273K + 20^\circ C = 293K.$$

Instruments

The instruments used to measure and read temperature takes into account changes in the properties of materials, electrical phenomena incandescence, radiation and melting.

Thermometer

Types of thermometer

- Forehead strips
- Wearable thermometers
- Pacifier thermometers

- Ear thermometers (tympenic)
- Forehead thermometers (temporal)
- Digital thermometers
- Mom's hand or lips

They are based on the principle that liquids and solids expand when they are subjected to heat. Mercury and alcohol expand uniformly. When heat is applied the volume of the liquid increases and the liquid rises in the capillary tube integral with the container. Mostly mercury is used in this type of thermometers because of its properties (Shiny and will not adhere to the glass tubes and we can measure up to 300°C.

The bimetal thermometer consists of metals with different coefficient of expansion. The bimetal is twisted into a spiral which curls when the temperature rises.

Pyrometer

Thermoelectric pyrometer is based on the principle that the soldering point between the wires of different metals, when heated a contact voltage is generated. The voltage depends upon the temperature difference between the hot measuring point and the cold end of the wire. Thermocouple elements are constructed of copper and Constant (up to 600°C) or of platinum and platinum-rhodium (up to 1600°C)

Radiation pyrometers are used to measure temperatures of red hot metals up to 3000°C. These concentrate thermal rays through an optical lens and focus them on to a thermo element. The scale of the ammeter is calibrated in degrees Celsius or Kelvin.

Transmission of Heat

Heat is a form of energy and is capable of doing work. Heat flows from a hot body to a colder body or from a point of high temperature to a point of low temperature. The greater is the temperature difference the more rapidly will be the heat flow. Heat is transmitted in three ways.

- 1 Conduction
- 2 Convection
- 3 Radiation

Conduction

Conduction is the name given to the transmission of heat energy by contact. The heat source is in contact with the Conductor. (metal rod). The rod is in contact with a thermometer. Due to Conduction heat is transferred from the heated end to the free end. In general good electrical conductors are also good heat conductors and good electrical insulators are also good heat insulators. A good heat insulator does not necessarily withstand high temperature.

Convection

Convection is the name given to the transmission of heat energy by the up-ward flow. When heated, the fluid (liquid/gas) becomes less dense and because of its mobility, is displaced upwards, by a similar but colder and more dense fluid. e.g., The domestic hot water system, The cooling system in motor cars.

Radiation

Heat is radiated or transmitted from one object to the other in space without actually being in contact, by means of electro-magnetic waves. These waves are similar to light waves and radio waves. They can be refracted by lenses and reflected by mirrors. This radiation is called infrared. It requires no medium to carry the radiation. (e.g) The heat of the sun travels through the space.

**Transmission of heat takes place in three ways
Conduction, Convection and Radiation.**

Expansion due to heat

When a solid, liquid or gaseous substance is heated, it expands and volume is increased. Similarly when it is cooled, it contracts (shrinks) and volume is decreased.

E.g : small gaps are left in between the lines of railway track to allow for expansion during summer. If this is not done, the rails would expand and bend there by causing derailment of trains.

Except a few substances, all solids, liquids and gases expand. For the same amount of heat given, the expansion of liquids is greater than solid and expansion of gas is more than liquid.

Volume of water is reducing while heating from 0°C to 4°C. After that volume is increasing. The data at 4°C of water will be taken as reference point for any calculations relating with water.

Basic Electricity - Introduction and uses of electricity, molecule, atom, how electricity is produced, electric current AC,DC their comparison, voltage, resistance and their units

Electricity is a kind of energy. It is the most useful sources of energy which is not visible but its presence can be felt by its effects. Electricity is obtained by conversion of other forms of energy like heat energy, chemical energy, nuclear energy, mechanical energy and energy stored in water etc.,

To understand electricity, one must understand the structure of an atom.

Basically an atom contains electrons, protons and neutrons. The protons and neutrons are located in the centre of an atom and the electrons, a negative electric charge particle revolving around the nucleus in an atom. The proton has a positive charge. Neutrons are neutral and have no charge.

Sources of electricity

Battery

Battery stores electrical energy in the form of chemical energy and it gives power when required. Battery is used in automobiles and electronics, etc.,

Generator

It is a machine which converts the mechanical energy into electrical energy.

When a conductor rotates between a magnetic field using prime mover an emf will be induced. By using this method all types of AC and DC generator - generates power.

- E.g. Thermal power station
- Hydro power station
- Nuclear power station
- Wind power station
- Solar power station

Thermo couple

If two dissimilar pieces of metals are twisted together and its joined end is heated in a flame, then a potential difference or voltage will be induced across the ends of the wires. Such a device is known as a Thermo couple. Thermo couple is used to measure very high temperature of furnaces.

Effects of electric current

When an electric current flows through a medium, its presence can be felt by its effects, which are given below.

1 Physical effect

Human body is a good conductor. when the body touches the bare current carrying conductor, current flows through the human body to earth and body gets severe shock or cause even death in many cases.

2 Magnetic effect

When an electric current passes through a coil, a magnetic field is produced around it.

E.g. : Electromagnet Motor, Generator, Electric bell

3 Chemical effect

When an electric current passes through an electrolyte, chemical action takes place. Because of that, an electrical energy is stored in a battery as a chemical energy.

E.g.: Electroplating, Cells and battery charging, refining of metals etc.,

4 Heating effect

When an electric current passes through any conductor, heat is produced in the conductor due to its resistance.

E.g. : Electric heater, Electric iron box, Electric lamp, Geyser, Soldering iron, Electric kettles, Electric welding etc.,

5 X-ray and Laser rays effect

When a high frequency voltage is passed through a vacuum tube, a special type of rays come out, which is not visible. These rays are called x-rays. Laser rays also can be produced by electric current.

6 Gas effect

When electrons pass through a certain type of sealed glass shell containing gas, then it emits light rays.

E.g: Mercury vapour lamp, Sodium vapour lamp, Fluorescent lamp, Neon lamp etc.,

Uses of Electricity

- 1 Lighting - Lamps
- 2 Heating - Heaters, ovens
- 3 Power - Motor, fan
- 4 Traction - Electromotive, lift, crane
- 5 Communication - Telephone, telegraph, radio, wireless
- 6 Entertainment - Cinema, radio, T.V.
- 7 Medical - x-rays, shock treatment
- 8 Chemical - Battery charging, electroplating
- 9 Magnetic - Temporary magnets
- 10 Engineering - Magnetic chucks, welding, x-rays of welding

Classification

- Static electricity
- Dynamic electricity

STATIC ELECTRICITY

If a dry glass rod is rubbed with silk cloth the glass rod gives out negative electrons, and therefore, becomes positively charged. The silk cloth receives negative electrons and therefore it becomes negatively charged. They acquire the property of attracting small pieces of paper etc. because like charges repel and unlike charges attract each other. The electric charge on the silk cloth is stationary and is called static electricity. This type of electricity cannot be transmitted from one place to another.

DYNAMIC ELECTRICITY

The electrons in motion are called current electricity or electric current. This type of electricity is carried through wires and cables. Therefore, this electricity can be transmitted from one place to another. This type of electricity can be produced by cells, batteries, generators alternators etc.

What is the difference between an atom and an element? How are molecules different from atoms? I am often asked these questions in my sessions over and over again and so I finally decided to write a comprehensive post on them. Find answers to all your questions in this section that is designed to help students explore and understand the relationship between atoms, elements, molecules, compounds and mixtures in a manner that is simple and easy to understand.

What is an Atom?

All the matter in the universe is made of tiny particles called atoms. There are 92 different kinds of atoms in nature. These 92 different atoms combine with one another to form different kinds of matter that we see in nature. (Fig 1)

Gold, for example, is made of only gold atoms. When matter is made of only one kind of atom, it is called an element. In the same way, silver is another element which is made of only silver atoms. Because there are 92 different kinds of atoms in nature, there are 92 different kinds of elements. Other examples of an atom are K (potassium) and Fe (iron).

What is a Molecule?

A molecule is the smallest unit of a chemical compound and it exhibits the same chemical properties of that specific compound. As molecules are made up of atoms jointly held by chemical bonds, they can vary greatly in terms of complexity and size. The oxygen we breathe has a molecular formula O_2 . Should we consider this as an element or compound? When two or more atoms of the same elements combine together, we call them Molecules. So, we call O_2 as an oxygen molecule. In the same way, we find hydrogen molecules H_2 , chlorine molecules Cl_2 and others in nature.

Types of electric current

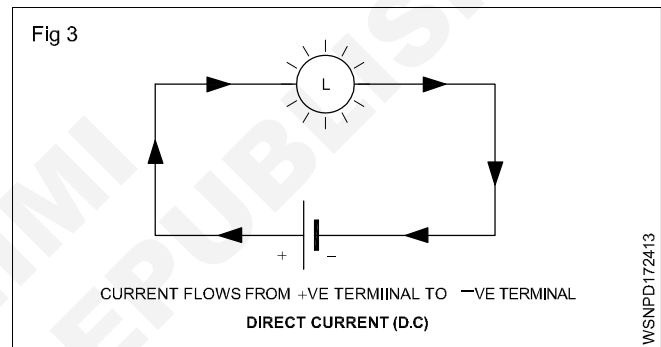

- Direct current
- Alternating current

Direct current

In direct current (DC) the direction and magnitude of the current does not change (Fig 2). The steady current flow will be from the positive terminal to the negative terminal. (Fig 3)

Examples

DC Sources : Cells, batteries and DC generators (Fig 3)

Alternating current (Fig 4)

The current flow will be from the phase terminal to the Neutral terminal. In the alternating current (AC) both the direction and magnitude of the current will be changing at definite intervals of time. The graph shows how an AC current or voltage changes with time. The current increases to the maximum value in one direction, falls to zero and increases to the maximum value in the other (opposite) direction before falling to zero again. Thus a cycle is one complete series of changes. The normal supply frequency is 50 cycles per second.

Difference between AC and DC

AC	DC
1 It is generated in the ranges of 6,600 V, 11000 V and 33,000 V.	It is generated up to 6,600 V only
2 Voltage can be stepped up or stepped down by using transformer	It is not possible
3 Transmission cost is less	Cost High
4 Less maintenance	High maintenance
5 Power up to 5,00,000 kw can be generated in a single alternator.	Power up to 10,000 kw can be generated in a single generator
6 AC generator can run at high speeds. So, speed control is not easy.	It can't run at high speeds. Speed control is easy.
7 Slip rings and brushes are used to collect the current.	Commutator and brushes are used to collect the current

Advantages of A.C.

- i In transmission there is saving in copper wire.
- ii Since there is no spark in A.C. machine there is no interference in Radio sound.
- iii This can be produced to maximum voltage i.e. 33000volts.
- iv Voltage can be dropped or raised with the help of transformers.
- v Its mechanism is simple and cheap.
- vi Output is more due to availability of more than one phase.

Disadvantages of A.C.:

- i A single phase motor is not self-starter.
- ii Due to thin wire in A.C., the voltage drop is more.
- iii It cannot be used for electroplating and in charging secondary cells.
- iv The speed of motors run by it is difficult to change.
- v There is danger to security due to high voltage.

Electrical terms and units

Quantity of electricity

The strength of the current in any conductor is equal to the quantity of electrical charge that flows across any section of it in one second. If 'Q' is the charge and 't' is the time taken

$$\text{then } I = \frac{Q}{t} \quad Q = I \times t$$

The SI unit of current is coulomb. Coulomb is equivalent to the charge contained in nearly 6.24×10^{18} electrons.

Coulomb

In an electric circuit if one Ampere of current passes in one second, then it is called one coulomb. It is also called ampere second (As). Its larger unit is ampere hour (AH)

$$1 \text{ AH} = 3600 \text{ As (or) } 3600 \text{ coulomb}$$

Electro motive force (EMF)

It is the force which causes to flow the free electrons in any closed circuit due to difference in electrical pressure or potential. It is represented by 'E.' Its unit is Volt.

Potential difference (P.D)

This is the difference in electrical potential measured across two points of the circuit. Potential difference is always less than EMF. The supply voltage is called potential difference. It is represented by V.

Voltage

It is the electric potential between two lines or phase and neutral. Its unit is volt. Voltmeter is used to measure voltage and it is connected parallel between the supply terminals.

Volt

It is defined as when a current of 1 ampere flows through a resistance of 1 ohm, it is said to have potential difference of 1 volt.

Current

It is the flow of electrons in any conductor is called current. It is represented by 'I' and its unit is Ampere. Ammeter is used to measure the current by connecting series with the circuit.

Ampere

When 6.24×10^{18} electrons flow in one second across any cross section of any conductor, the current in it is one ampere. (or) If the potential difference across the two ends of a conductor is 1 volt and the resistance of conductor is 1 ohm then the current through is 1 ampere.

Resistance

It is the property of a substance to oppose to the flow of electric current through it, is called resistance. Symbol: R, Unit : Ohm (Ω), Ohm meter is used to measure the resistance.

Ohm

If the potential difference across the two ends of conductor is 1 volt and the current through it is 1 ampere, then the resistance of the conductor is 1 Ohm.

Laws of resistance

The resistance offered by conductor depends on the following factors.

The resistance of the conductor

- 1 is directly proportional to the length of the conductor ($R \propto L$)
- 2 Varies inversely proportional to its cross sectional area of the conductor ($R \propto \frac{1}{A}$)
- 3 Depends on the material with which it is made.

- 4 depends on the temperature of the conductor

$$R \propto L ; R \propto \frac{1}{A} ; R \propto \frac{L}{A} ; R = \rho \frac{L}{A}$$

Specific resistance

The specific resistance of a material is the resistance offered to a current it passed between the opposite faces of the unit cube of the material. Specific resistance is measured in Ohm - m or micro ohm - cm.

Each material has its own specific resistance or resistivity.

E.g. : Copper - 1.72 $\mu\Omega$ cm, Silver - 1.64 $\mu\Omega$ cm, Eureka - 38.5 $\mu\Omega$ cm, Iron - 9.8 $\mu\Omega$ cm, Aluminium - 2.8 $\mu\Omega$ cm, Nickel - 7.8 $\mu\Omega$ cm.

$$R = \frac{\rho l}{A} \text{ ohm cm}$$

R = Resistance in ohms

l = Length of the conductor in cm

ρ = Specific Resistance in ohm cm
(symbol pronounced as rho)

A = Area of cross - section in cm^2

Basic Electricity - Conductor, insulator, types of connections - series and parallel

Conductors

Some materials and metals readily allow passage for electric current to flow. In such materials, called conductors, electrons are able to pass readily from atom to atom.

Properties of conductors

A good conductor should have the following properties.

Electrical properties

- The conductivity must be good.
- Electrical energy spent in the form of heat must be low.
- Resistivity must be low (to reduce voltage drop and loss).
- Increase in resistance with temperature must be low.

Mechanical properties

- Ductility (the property of being drawn into thin wires).
- Solderability: the joint should have minimum contact resistance.
- Resistance to corrosion: should not get rusted when used outdoors.
- Should withstand stress and strain.
- It should be easy to fabricate.

Economical factors

- Low cost.
- Easy availability.
- Easy to manufacture.

Classification of conductors

The best conductors are metallic. The commonly used conductors in electrical appliances and machines are described hereunder.

Silver

It is a soft and extremely malleable metal. Even though it is the best conductor, its use is limited because of its high cost.

Copper

It is a very good conductor. It is malleable and ductile, and also has high resistance to corrosion by liquids. Therefore, it is widely used for wires, cables, overhead conductors, bus bars and conducting parts of various electrical appliances.

Aluminium

It is a metal light in weight. It is also ductile, malleable and a good conductor of electricity. Nowadays, it is more widely used (since it is cheaper than copper) for wires and cables. All aluminium conductors (AAC) and aluminium conductors (steel reinforced) (ACSR) are used in overhead and transmission lines. (More details on copper and aluminium are furnished under the topic 'non-ferrous metals and alloys as applicable to electrical trades').

RESISTANCE WIRES

These are conductors with very high resistance for specific applications like filaments of incandescent lamps, heating elements etc. The following are a few examples:

- | | | |
|-----------------|------------|------------|
| 1 Tungsten | 2 Nichrome | 3 Eureka |
| 4 German silver | 5 Manganin | 6 Platinum |
| 7 Mercury | 8 Carbon | 9 Brass. |

The resistance values of the metallic resistances will increase with increase in temperature.

insulators

Description

These are the materials which offer very high resistance to the flow of current and make current flow very negligible or nil. These materials have very high resistance - usually of many megohms (1 megohm = 10⁶ ohms) per centimetre cube. The insulators should also possess high dielectric strength. This means that the insulating material should not break down or puncture even on application of a high voltage (or high electrical pressure) to a given thickness.

Properties of insulators

The main requirements of a good insulating material are:

- high specific resistance (many megohms/cm cube) to reduce the leakage currents to a negligible value
- good dielectric strength i.e. high value of breakdown voltage (expressed in kilovolts per mm)
- good mechanical strength, in tension or compression (It must resist the stresses set up during erection and under working conditions.)
- little deterioration with rise in temperature (The insulating properties should not change much with the rise in temperature i.e. when electrical machines are loaded.)
- non-absorption of moisture, when exposed to damp atmospheric condition. (The insulating properties, specially specific resistance and dielectric strength decrease considerably with the absorption of even a slight amount of moisture.)

Classification of insulators (Fig 1)

Air is an example of a gaseous insulator. Other examples are hydrogen, nitrogen and inert gases.

Liquid insulators

Mineral oils, synthetic liquids, resins and varnishes are the liquid insulators.

Transformer oil

In transformers the oil is used as an insulator and also for cooling of the transformer windings by convection. Therefore, the transformer oil should be dry and purified, since the presence of moisture will reduce the dielectric strength of the oil.

Purpose of transformer oil

- Transfer of heat by convection, from winding and core to the cooling surfaces.
- It maintains the insulation of winding and also extinguishes fire that occurs due to faults occurring in the windings.

Precaution

The insulating value of a transformer oil is reduced due to the formation of sludge as a result of oxidation due to air and temperature. To minimise oxidation, the oil should not be exposed to air.

Sludge is also formed due to the presence of acids and alkalis.

Sludge formation

- Reduces the rate of heat transfer.
- Blocks the ducts.
- Increases the operating temperature.

To prevent moisture from entering the oil, the whole apparatus is made airtight, and calcium chloride, silicagel fillets are used.

Testing of transformer oil as per ISI Standard (Fig 2)

Dielectrical strength test (Refer to Fig 2): The oil should be 40 mm above and 40 mm below the electrodes. The gap between the two electrodes should be kept at $4\text{ mm} \pm 0.02\text{ mm}$.

A high voltage is applied across the electrodes through a step-up transformer, and increased till there is a spark in between the electrodes. The voltage noted on the voltmeters, when the spark occurs, is the breakdown voltage or dielectric strength of the oil. This is the maximum voltage the oil can withstand.

According to ISI specifications, the oil should be able to withstand 40 kV for one minute with a gap ($4\text{ mm} \pm 0.02\text{ mm}$) between the electrodes and with the diameter of the electrodes as 13 mm.

Moisture test : In this test, an oil sample is cooled in a closed vessel down to $15\text{--}25^\circ$. A dry test tube, 12.5 mm in diameter and 125 mm long, is taken and an adequate quantity of oil is poured into it.

The tube containing the oil is heated rapidly with the help of an electric heater till the oil begins to boil. During the process, oil should not produce cracking.

The other tests are:

- acidity test
- sludge resistance test.

Electrical insulating varnishes

They are of two types

Oil and resin varnishes.

Solid insulators/insulating materials

Sl. No.	Classification	Examples
1	Mineral insulators	Mica, marble, slate.
2	Vitreous materials	Glass, quartz, procelain.
3	Rubber and rubber products	Rubber, vulcanised (India) rubber (V.I.R) ebonite
4	Waxes and compounds	Paraffin wax, bitumen.
5	Fibrous materials	Asbestos, paper, wood, Press pahn, leatheroid, cotton, silk, tapes etc.
6	Synthetic products	Bakelite, shellac, oil (for Transformer, Switchgear etc).

Paper

Various grades of insulating paper are available for use in capacitors, cables, etc. Paper, if moist, loses its insulating property. Therefore, it is used in an impregnated condition.

Wood

It is impregnated with oil or other substance for use as an insulator.

For example, in machine windings, bamboo wood is used as slot wedges.

Press board

It is widely used in windings to insulate parts which support windings. It is also used as spacers in electrical devices and transformers.

Asbestos

A fibrous, incombustible, fire-proof material - used for panel boards and as frames for winding resistance wires of regulators, rheostats etc.

Cotton

It is soaked in paraffin to avoid moisture. It is a good insulator for low voltages. It is used in conductors for armatures and field coils.

Silk

Like cotton, it is used for small jobs like telephone coils.

Tapes

Tapes of various types are used, such as cotton, silk, jute etc either pure or in impregnated form.

Empire cloth

It is made by varnishing a cotton cloth, silk or paper. It is not effected by moisture. It is available in yellow and black colours in different sizes. It is used as slots insulation in winding works and for coil insulation.

Press pahn

Press pahn is a form of paper made from hemp, rags, and wood pulp by special chemical treatment. It is widely used for lining armature slots, insulating coil sides, etc.

Leatheroid

It is a tough material made from cotton rags with chemical treatment. It is unaffected by grease or oil and is used for slot and coil insulation, transformer core coverings, etc.

Adhesive tape

It is used widely for taping of ends of conductors, leads and connections. Adhesive tape is made from cotton fabric coated with a compound of rubber, bitumen, resin, gum,

etc. It dries when exposed to air. It is available in sizes $\frac{1}{2}$, $\frac{3}{4}$ ", 1" etc. These are also available as P.V.C. adhesive tape, cotton and bitumen tapes.

Bitumen

It is used for filling cable jointing boxes and for sealing the tops of the batteries etc. It is waterproof, but it will crack

under certain conditions. It can be vulcanised in the same manner as rubber.

Mica

It is a mineral and available as large slabs. It can be easily separated into thin sheets. It is fireproof, waterproof, and is a good insulator. It should be used carefully since it is liable to crack. It is used in heating elements of electric iron etc.

Marble and slate

Marble and slate are mechanically strong insulators and are non- hygroscopic. When polished they form good mountings for switchboards, switches, resistance frames, etc. Slate is used generally for low voltages.

Micanite

It is made by sticking together pieces of mica with insulating cement like shellac. It can be bent to any shape by heating and pressing. Therefore, it is used as insulator for slots of armatures and to insulate the commutator from the shaft.

Paraffin wax

It melts at 55°C and does not absorb water. It is used to impregnate paper, wood, pressboard etc to reduce their moisture absorption.

Bakelite

It can be moulded to any shape. It is heat-resistant and highly insulating. It will not absorb oil and moisture. It is used for bodies of switches, plugs, holders, regulators etc.

Rubber

It has high insulating properties. It is used mainly on lighting cables and for flexible cables. It deteriorates gradually when exposed to atmosphere. Rubber is being replaced now by elastic plastics such as PVC or polyethylene which can resist alkalis, acids and mineral oils.

Valcanised India Rubber (VIR)

This is manufactured by treating pure rubber with sulphur. It is stronger than pure rubber and is not affected much by change in temperatures. It is used as coverings for low and medium voltage wires and cables.

Ebonite or vulcanite

Ebonite or Vulcanite is vulcanised rubber containing about 30% to 50% of sulphur, and subjected to a prolonged heating at 150°C. The material is hard and can be moulded into different shapes. It is less affected by chemicals and moisture. It is used for making containers of lead acid batteries, cases for instruments and switchgears, terminal plates and low voltage panel boards etc. It should not be subjected to heat.

Shellac

It is a good varnish which is used to improve the insulation and moisture resisting properties of paper, cloth, wood, slate etc.

Enamel

By this, an insulation coating is given on winding wires.

Polychloroprene (PCP)

It is a plastic material used for insulation of cables. It is resistant to oil and petrol. It can be used in conditions of exposure to sulphur fumes, steam, ammonia, lactic acid and direct sunlight.

Glass

It is heat-resistant and suitable for high temperatures. It is used as insulators, envelopes for lamps, radio tubes etc.

Quartz

Quartz (Silica) is a good insulator. As it has a very low temperature coefficient of expansion, it does not crack with sudden variations in temperature. It is used for pyrometer sheaths, for heating elements, sparking plugs, etc.

Porcelain

Porcelain is not so brittle as glass and is very widely used for carrying bare conductors, for making fuse carriers and other electrical fittings.

Red fibre

Mainly used in motor and transformer winding work, for slot insulation, separators etc.

Insulators classified according to their temperature limits

The permissible temperature limit at which the insulators may be worked safely without deterioration, depends upon the type and class of the insulation as detailed below. (IS:1271/1958)

Class Y – maximum temperature 90°C

Cotton, silk, paper products, press board, wood, vulcanised fibre - not impregnated or immersed in oil.

Class A – maximum temperature 105°C

Cotton, silk, paper products, wood, vulcanised fibre when impregnated or immersed in liquid dielectric, varnished paper and wire enamel (class A).

Class E – maximum temperature 120°C

Wire enamel, cotton fabric and paper laminates treated with oil, modified asphalt and synthetic resins, varnished polyethylene, textile treated with suitable varnish.

Class B – Maximum temperature 130°C

Glass fibre, asbestos, varnished glass fibre, textile, varnished asbestos, built up mica treated with synthetic resin varnishes.

Class F – maximum temperature 155°C

Similar to class B materials but treated with silicone resins.

Class H – maximum temperature 180°C

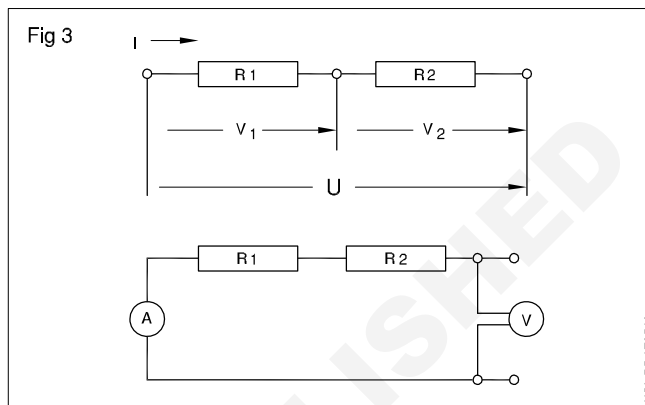

Same as class F materials but treated with silicone resins of higher thermal stability than class F.

Class C – maximum temperature above 180°C

Mica, porcelain and other ceramics, glass, quartz, asbestos, treated glass fibre textile, treated asbestos, built up mica treated with silicone resins possessing superior thermal stability (limited stability up to 225°C).

Series Connection

The total resistance is equal to the sum of all the resistances. In a series connection the end of the first load is connected to the beginning of the second load and all loads are connected end to end. (Fig 3)

Features of series connection:

- The same current flows through all the loads.
- The voltage across each load is proportional to the resistance of the load.
- The sum of the voltages across each load is equal to the applied voltage.
- The Total resistance is equal to the sum of all the resistances.

$$I = I_1 = I_2 = \dots$$

$$V = V_1 + V_2 + \dots$$

$$R = R_1 + R_2 + \dots$$

Example

Three resistances of 3 ohms, 9 ohms and 5 ohms are connected in series. Find their resultant resistance.

Solution

$$\begin{aligned} R &= R_1 + R_2 + R_3 \\ &= 3 \Omega + 9 \Omega + 5 \Omega \end{aligned}$$

$$\text{Total resistance} = 17 \Omega$$

Parallel connection

In a parallel connection the beginning and the ends of the loads are connected together.

Features of parallel connection:

- The current flowing through each load depends upon the resistance of the load.
- The voltage across each load is the same and is equal to the voltage applied to the circuit.

Fig 4

WSNPD172514

- The total resistance of a parallel connection is always smaller than the smallest resistance in the circuit.
- In parallel connection the reciprocal of the total resistance is equal to the sum of the reciprocals of all resistances in the circuit.

$$I = I_1 + I_2 + \dots$$

$$V = V_1 = V_2 \dots$$

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} + \dots$$

Example

Two resistances of 4 ohms and 6 ohms are connected in parallel. Determine the total resistance.

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} + \dots \quad (\text{since parallel connection})$$

Therefore $\frac{1}{R} = \frac{1}{4} + \frac{1}{6} = \frac{10}{24} = \frac{5}{12}$

Therefore $R = \frac{24}{10}$ ohms = 2.4 ohms

Example

Two resistors of 2 and 4 ohms are switched in parallel to a 6V battery

- Calculate the total resistance
- Find the total current and partial current.

Fig 5

WSNPD172515

Solution

Total resistance

$$\begin{aligned} \frac{1}{R_{\text{tot}}} &= \frac{1}{R_1} + \frac{1}{R_2} \\ &= \frac{1}{2} + \frac{1}{4} = \frac{2+1}{4} \\ &= \frac{3}{4} \Omega \end{aligned}$$

$$R_{\text{tot}} = \frac{4}{3} = 1\frac{1}{3} \Omega$$

I Total = I₁ + I₂ current

But $I_1 = \frac{U}{R_1} = \frac{6V}{2\Omega} = 3A$

$$I_2 = \frac{U}{R_2} = \frac{6V}{4\Omega} = 1.5A$$

I total = 3A + 1.5A
= 4.5 Amp

Basic Electricity - Ohm's law, relation between V.I.R & related problems

Ohm's law

V - Voltage in volts

I - Current in Ampere

R - Resistance in ohms.

In any closed circuit the basic parametres of electricity (Voltage, Current and resistance) are in a fixed relationship to each other.

Basic values

To clarify the basic electrical values, they can be compared to a water tap under pressure

Water pressure	- electron pressure	- Voltage
Amount of water	- electron flow	- Current
throttling of tap	- obstruction to electron flow	- Resistance

Relationships

If the resistance is kept constant and the voltage is increased, the current is increased

$$I \propto V$$

If voltage is constant and the resistance is increased, current is decreased

$$I \propto \frac{1}{R}$$

Ohm's law

From the above two relationships we obtain Ohm's law,

$$I = \frac{V}{R} \text{ which is conveniently written as } V = R.I.$$

Ohm's law states that at constant temperature the current passing through a closed circuit is directly proportional to the potential difference, and inversely proportional to the resistance.

By Ohm's law $I = \frac{V}{R}$

EXAMPLE

A bulb takes a current of 0.2 amps at a voltage of 3.6 volts. Determine the resistance of the filament of the bulb to find R. Given that V = 3.6 V and I = 0.2 A.

To find 'R'. Given that V = 3.6V and I = 0.2 A

Therefore $V = I \times R$

$3.6 \text{ V} = 0.2 \text{ A} \times R$

Therefore $R = \frac{3.6V}{0.2A} = 18 \text{ ohms}$

Example

The voltage supply to a filament lamp is 10.8V. The voltage should be 12V. Find out loss of voltage.(Fig 5)

$$\text{Voltage drop} = 12\text{V} - 10.8 = 1.2\text{V}$$

The supply voltage is called Potential difference.

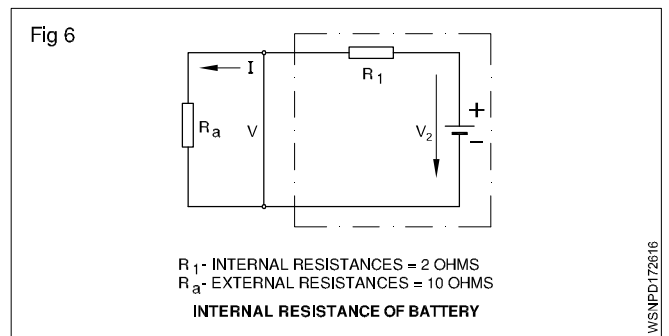

Example

The Internal resistance of a dynamo is 0.1 ohm. The voltage of dynamo is 12V. What is the Voltage of dynamo when a current of 20 amps being supplied to an outside circuit.

Solution

$$\begin{aligned} \text{Voltage drop} &= \text{Current} \times \text{Internal resistance} \\ &= 20 \times 0.1 \text{ volts} \\ &= 2 \text{ volts} \end{aligned}$$

Example (Fig 6)

The Internal resistance of a Battery is 2 ohms. When a resistance of 10 ohms is connected to a battery it draws 0.6 amps. What is the EMF of the battery.

$$\text{P.D} = \text{Current flowing} \times \text{Resistance}$$

$$= 0.6 \text{ A} \times 10\Omega$$

$$= 6 \text{ volts}$$

$$\text{V.D} = \text{Current flowing} \times \text{Internal resistance of battery}$$

$$= 0.6 \times 2 \text{ volts}$$

$$= 1.2 \text{ volts}$$

$$\text{EMF of the Battery} = (6.00 + 1.2)\text{V}$$

$$= 7.2 \text{ volts}$$

Resistance connections

V - Voltage (in volts)

R - Resistance (in ohms)

I - Current intensity (in Amperes)

Assignment

$$\begin{aligned} R &= 40 \text{ Ohms} \\ I &= 6.5 \text{ Amps} \\ V &= \text{_____ Volts} \end{aligned}$$

$$\begin{aligned} I &= 4.5 \text{ Amps} \\ V &= 220 \text{ Volts} \\ R &= \text{_____ Ohms} \end{aligned}$$

$$\begin{aligned} V &= 6 \text{ Volts} \\ I &= 0.5 \text{ Amps} \\ R &= \text{_____ Ohms} \end{aligned}$$

$$\begin{aligned} R &= 50 \text{ Ohms} \\ V &= 220 \text{ Volts} \\ I &= \text{_____ Amps} \end{aligned}$$

$$\begin{aligned} V &= 220 \text{ Volts} \\ R &= 820 \text{ Ohms} \\ I &= \text{_____ Amps} \end{aligned}$$

$$\begin{aligned} V &= 110 \text{ Volts} \\ I &= 4.55 \text{ Amps} \\ R &= \text{_____ Ohms} \end{aligned}$$

Workshop Calculation & Science - Electrician - Power Distribution Exercise 1.7.27

Basic Electricity - Electrical power, energy and their units, calculation with assignments

Electric Power

In mechanical terms we defined power as the rate of doing work. The unit of power is Watt. In an electrical circuit also the unit of electrical power is 1 Watt. In mechanical terms 1 Watt is the work done by a force of 1 N to move the body through 1 metre in one second. In an electrical circuit, the electromotive force overcomes the resistance and does work. The rate of doing work depends upon the current flowing in the circuit in amperes. When an e.m.f of one volt causes a current of 1 ampere to flow the power is 1 Watt.

Hence Power = Voltage x Current

$$P = V \times I$$

Power in Watts = Voltage in Volts x Current in Amperes

Electric work, energy

Electrical work or energy is the product of electrical power and time

Work in Watt seconds = Power in Watts x time in sec
 $W = P \times t$

Since 1 joule represents 1 Watt x 1 sec, which is very small, larger units such as 1 Watt hour and 1 kilowatt hour are used.

$$1 \text{ W.h} = 3600 \text{ Watt sec.}$$

$$1 \text{ Kwh} = 1000 \text{ Wh} = 3600000 \text{ Watt sec}$$

FPS System

$$1 \text{ HP} = 746 \text{ watts}$$

$$= 0.746 \text{ K.W}$$

Metric System

$$1 \text{ HP} = 735.6 \text{ watts}$$

$$= 0.7356 \text{ K.W}$$

Note: The charge for electric consumption is the energy cost per Kwh and it varies according to the country and states.

Fig 1

WSNPD172711

V - Voltage (Volts) V

i - Current Intensity (Amperes) A

P - Power (Watts, Kilowatts) W, kW

W - Work, Energy (Watt hour, Kilowatt hour) wh, Kwh

t - time (hours) h

Fig 2

WSNPD172712

Table of analogies between mechanical and electrical quantities

Mechanical quantity	Unit	Electrical quantity	Unit
Force 'F'	N	Voltage 'V'	V
Velocity $v = \frac{\text{Displacement}}{\text{Time}}$	m/s	Current <i>I</i>	A
Time <i>t</i>	seconds	Time <i>t</i>	seconds
Power $P = F \times v$	$N \frac{m}{\text{sec}}$	Power $P = V \times i$	$W = V \times A$
Energy = $F \times v \times t$	$j = \text{Nm}$	Energy $W = V \times i \times t$	$j = W \times s$

$$W = VI$$

$$= I^2R$$

$$= \frac{V^2}{R}$$

$$R = \frac{V}{I}$$

$$= \frac{V^2}{W}$$

$$= \frac{W}{I^2}$$

$$V = IR$$

$$= \frac{W}{I}$$

$$= \sqrt{WR}$$

$$I = \frac{V}{R}$$

$$= \frac{W}{V}$$

$$= \sqrt{\frac{W}{R}}$$

Example

- 1 Calculate the power rating of the lamp in the circuit, if 0.25 amperes of current flows and the voltage is 240 volts.

$$P = V \times I$$

$$V = 240 \text{ Volts}$$

$$I = 0.25 \text{ Ampere}$$

$$\begin{aligned} \text{Therefore Power} &= 240 \text{ Volts} \times 0.25 \text{ Amperes} \\ &= 60 \text{ Volts Ampere} \end{aligned}$$

$$\text{But } 1 \text{ Watt} = 1 \text{ Volt} \times 1 \text{ Ampere}$$

$$\text{Therefore Power} = 60 \text{ Watts}$$

- 2 A current of 15 amperes flow through a resistance of 10 Ohms. Calculate the power in kilowatts consumed.

$$\text{Given that } R = 10 \text{ and } I = 15 \text{ A}$$

$$\text{Power} = V \times I = I \times R \times I = I^2 \times R$$

$$\text{Therefore Power} = 15^2 \times 10 = 2250 \text{ Watts} = 2.25 \text{ kW}$$

- 3 At a line voltage of 200 Volts a bulb consumes a current of 0.91 amperes. If the bulb is on for 12 hour calculate the work in Wh to find the work given that V = 200 Volts.

$$I = 0.91 \text{ Amps.}$$

$$t = 12 \text{ hours}$$

$$\begin{aligned} \text{Therefore Power} &= V \times I = 200 \text{ Volts} \times 0.91 \text{ Amps} \\ &= 182 \text{ Watts} \end{aligned}$$

$$\begin{aligned} \text{Therefore Work} &= P \times t = 182 \text{ Watts} \times 12 \text{ hours} \\ &= 2184 \text{ Watt hour.} \end{aligned}$$

- 4 An adjustable resistor bears the following label: 1.5 k Ohms/0.08 A. What is its rated power?

$$\text{Given: } R = 1.5 \text{ k Ohms; } I = 0.08 \text{ A}$$

Find: P

$$V = R \times I = 1500 \text{ Ohms} \cdot 0.08 \text{ A} = 120 \text{ volts}$$

$$P = V \times I = 120 \text{ volts} \cdot 0.08 \text{ A} = 9.6 \text{ W alternatively:}$$

$$P = I^2 \cdot R = (0.08 \text{ A})^2 \cdot 1500 \text{ Ohms} = 9.6 \text{ W.}$$

- 5 Find the current and power consumed by an electric iron having 110Ω resistance when feed from a 220 v supply

$$\text{Resistance of electric iron (R)} = 110 \text{ ohms}$$

$$\text{Voltage (V)} = 220 \text{ volts}$$

$$\begin{aligned} \text{Current (I)} &= \frac{V}{R} \\ &= \frac{220}{110} = 2 \text{ amperes} \\ \text{Power (w)} &= V \times I \\ &= 220 \times 2 \\ &= 440 \text{ watts} \end{aligned}$$

- 6 Find the total power if four 1000 W, 180 volt heaters are connected in series across 240 V supply and current carrying capacity is 15 amp. Find the total power.

$$\text{Connection} = \text{Series}$$

$$\text{No. of heaters} = 4$$

$$\text{Heater power (W)} = 1000 \text{ watts}$$

$$\text{Heater voltage} = 180 \text{ V}$$

$$\text{Supply voltage} = 240 \text{ V}$$

$$\begin{aligned} \text{Heater resistance (R)} &= \frac{V^2}{W} \\ &= \frac{180 \times 180}{1000} = \frac{324}{10} \\ &= 32.4 \text{ ohms} \end{aligned}$$

$$\text{Total resistance} = 32.4 \times 4 = 129.6 \text{ ohms}$$

$$\begin{aligned} \text{Total current (I)} &= \frac{V}{R} \\ &= \frac{240}{129.6} = 1.85 \text{ amperes} \end{aligned}$$

$$\begin{aligned} \text{Total Power (W)} &= V \times I \\ &= 240 \times 1.85 = 444 \text{ watts} \end{aligned}$$

- 7 If a 40 watt fluorescent lamp draws a current of 0.10 ampere. How much voltage will be required to illuminate it?

$$\text{Lamp power (W)} = 40 \text{ watt}$$

$$\text{Current (I)} = 0.10 \text{ ampere}$$

$$\begin{aligned} \text{Voltage (V)} &= \frac{W}{I} \\ &= \frac{40}{0.1} = 400 \text{ volts} \end{aligned}$$

- 8 Find the cost of running 15 HP motor for 15 days @ 6 hrs per day and the cost of energy is Rs. 3 per unit.

$$\begin{aligned} \text{Motor power (w)} &= 15 \text{ HP} \\ &= 15 \times 746 = 11,190 \text{ watts} \end{aligned}$$

$$\begin{aligned} \text{Consumption per day} &= 11,190 \times 6 \\ &= 67140 = 67.14 \text{ KWH} \end{aligned}$$

$$\begin{aligned} \text{Consumption for 15 days} &= 67.14 \times 15 \\ &= 1007 \text{ KWH (or) unit} \end{aligned}$$

$$\text{Cost per unit} = \text{Rs. } 3$$

$$\text{Cost for total energy} = 3 \times 1007 = \text{Rs. } 3021$$

Assignment

- 1  Current Consumed
 $I = 0.136 \text{ A}$
 Voltage 'V' = 220 V
 $P = \underline{\hspace{2cm}}$ Watts
-
- 2  $P = 500 \text{ Watts}$
 $I = 2.27 \text{ A}$
 $V = \underline{\hspace{2cm}} \text{ v}$
-
- 3  $P = 750 \text{ W}$
 $V = 220 \text{ v}$
 $I = \underline{\hspace{2cm}} \text{ A}$
-
- 4  $P = 60 \text{ W}$
 $V = 200 \text{ v}$
 $R = \underline{\hspace{2cm}} \text{ W}$
-
- 5  $I = 0.455 \text{ A}$
 $R = 484 \text{ ohms}$
 $P = \underline{\hspace{2cm}} \text{ Watts}$
-
- 6  $P = 550 \text{ W}$
 $R = 22 \text{ ohms}$
 $I = \underline{\hspace{2cm}} \text{ A}$
-

 Total cost
 $= \underline{\hspace{2cm}} \text{ Rupees}$
-
- 14  $I = 5.45 \text{ A}$
 $V = 220 \text{ v}$
 Energy consumed
 $= 1 \text{ kWh}$
 $t = \underline{\hspace{2cm}} \text{ hr.}$

Mensuration - Area and perimeter of square, rectangle and parallelogram

In Engineering field, an Engineer has to estimate the material, manpower, machinery, etc. required to prepare the geometrical objects. Hence we must be very conversant with all relevant formulae connected with geometrical objects.

- Length - l unit
- Breadth or width - b unit
- Diagonal - d unit
- Diameter - d unit

- Radius - r unit
- Semi perimeter - S unit
- Perimeter - P unit
- Circumference - C unit
- Area - A unit²
- Total surface area - T.S.A unit²
- Lateral surface area - L.S.A unit²
- Volume - V unit³

Square

This is also a four sided figure, opposite sides are parallel. All the four sides are equal. Angle between adjacent side are 90°.

$$A = a^2 \text{ (or) unit}^2$$

$$P = 4a \text{ unit}$$

$$d = \sqrt{2} a \text{ unit}$$

$$a = \frac{d}{\sqrt{2}} \text{ unit where } \sqrt{2} = 1.414$$

Find the area of a brass sheet in the form of a square whose perimeter is 31.2 cm.

$$\text{Perimeter}(P) = 4a = 31.2 \text{ cm}$$

$$\therefore a = \frac{31.2}{4} = 7.8 \text{ cm}$$

$$\text{Area}(A) = a^2$$

$$= 7.8 \times 7.8 = 60.84 \text{ cm}^2$$

Examples

- 1 Find out the circumference, diagonal and area of a square, whose side is 18 cm.
 - Side of the square (a) = 18 cm
 - Perimeter (P) = 4a
 - = 4 x 18 = 72 cm
 - Diagonal (d) = $\sqrt{2} \times a$
 - = $\sqrt{2} \times 18 = 1.414 \times 18$
 - = 25.45 cm

$$\text{Area}(A) = a^2$$

$$= 18 \times 18 = 324 \text{ cm}^2$$

Perimeter of square = 72 cm

Diagonal = 25.45 cm ; Area = 324 cm²

- 2 If the diagonal of a square measure 10 cm. Find area of the square.

$$\text{Diagonal of the square (d)} = \sqrt{2} a = 10 \text{ cm}$$

$$\text{Side (a)} = \frac{d}{\sqrt{2}}$$

$$\text{Area}(a^2) = \frac{d}{\sqrt{2}} \times \frac{d}{\sqrt{2}} = \frac{d^2}{2}$$

$$= \frac{10^2}{2} = \frac{100}{2}$$

$$= 50 \text{ cm}^2$$

Area of the square = 50 cm²

- 3 The perimeter of one square is 748 cm and that of Another is 336 cm. Find the total area of the two squares.

$$\text{Side of the square (a)} = \frac{\text{Perimeter}}{4}$$

1st square

$$\text{Side (a)} = \frac{\text{Perimeter of 1st square}}{4}$$

$$= \frac{748}{4} = 187 \text{ cm}$$

Area (A)

$$= a^2$$

$$= 187 \times 187$$

$$= 34,969 \text{ cm}^2$$

2nd square

$$\text{Side (a)} = \frac{\text{Perimeter of 2nd square}}{4}$$

$$= \frac{336}{4} = 84 \text{ cm}$$

$$\begin{aligned} \text{Area (A)} &= a^2 \\ &= 84 \times 84 \\ &= 7,056 \text{ cm}^2 \end{aligned}$$

$$\begin{aligned} \text{Total area of two squares} &= 34,969 + 7,056 \\ &= 42,025 \text{ cm}^2 \end{aligned}$$

Assignment

- Find the Area, Perimeter and diagonal of a square steel plate whose side measures 28.1 cm.
- Find the area of a square whose diagonal is equal to 8.5 cm.
- Find the area of the square if the side of the square is 28 cm.
- Find its side if the area of the square field is 169 m².
- Find the area of the square if the diagonal of the square is 20 cm.
- Find the perimeter of a square whose diagonal is 144 m.
- Find the area if the perimeter of a square plot is 48 m.

Rectangle

This is a four sided figure. Opposite sides are parallel. Angles between adjacent sides are 90°.

$$A = \text{Area} = \text{length} \times \text{breadth} = l \cdot b \cdot \text{unit}^2$$

$$P = \text{Perimeter} = 2(l + b) \text{ unit}$$

$$\text{Diagonal} = \sqrt{l^2 + b^2} \text{ unit}$$

Examples

- Find the Area, Perimeter and diagonal of a rectangle whose length and breadth are 144 mm and 60 mm respectively.

$$\begin{aligned} \text{Area} = A &= l \times b \text{ unit}^2 \\ &= 144 \times 60 = 8640 \text{ mm}^2 \end{aligned}$$

$$\begin{aligned} \text{Perimeter} = P &= 2(l + b) \text{ unit} \\ &= 2(144 + 60) \\ &= 2 \times 204 = 408 \text{ mm} \end{aligned}$$

$$\begin{aligned} \text{Diagonal} = d &= \sqrt{l^2 + b^2} \text{ unit} \\ &= \sqrt{144^2 + 60^2} \\ &= \sqrt{20736 + 3600} \\ &= \sqrt{24336} = 156 \text{ mm} \end{aligned}$$

- The perimeter of a rectangle is equal to 42 cm. If its breadth is 9 cm. Find the length of the rectangle.

$$\text{Perimeter} = 42 \text{ cm}$$

$$\text{Breath} = 9 \text{ cm}$$

$$\text{Length} = ?$$

$$\text{Perimeter} = P = 2(l + b)$$

$$2(l + 9) = 42$$

$$l + 9 = 42 \div 2$$

$$l + 9 = 21$$

$$l = 21 - 9$$

$$l = 12 \text{ cm}$$

- The perimeter of a rectangle is 48 cm and its length is 4 cm more than its width. Find the length and breadth of the rectangle.

$$\text{Perimeter (P)} = 48 \text{ cm}$$

$$\text{Breath (b)} = x$$

$$\text{Length (l)} = x + 4$$

$$2(l + b) = \text{Perimeter}$$

$$2(x + 4 + x) = 48$$

$$2(2x + 4) = 48$$

$$4x + 8 = 48$$

$$4x = 48 - 8$$

$$x = \frac{40}{4} = 10$$

$$x = \text{breadth} = 10 \text{ cm}$$

$$\text{length} = x + 4 = 10 + 4 = 14 \text{ cm}$$

- 4 How many rectangular pieces of 50 cm x 20 cm can be cut out from a sheet of 1000 cm x 500 cm.

Sheet size = 1000 cm x 500 cm

Size of the rectangular piece to be cut = 50 cm x 20 cm

$$\text{No. of pieces to be cut in lengthwise} = \frac{1000}{50} = 20$$

$$\text{No. of pieces to be cut in breadthwise} = \frac{500}{20} = 25$$

$$\begin{aligned} \text{Total no. of pieces to be cut out} &= 20 \times 25 \\ &= \mathbf{500} \end{aligned}$$

- 5 The perimeter of a rectangle is 320 metre. Its sides are in the ratio of 5:3. Find the area of the rectangle.

$$\text{Ratio} = 5:3 = l : b$$

$$\text{length } l = 5x$$

$$\text{breadth } b = 3x$$

$$2(l + b) = \text{Perimeter}$$

$$2(5x + 3x) = 320$$

$$2(8x) = 320$$

$$16x = 320$$

$$x = \frac{320}{16} = 20$$

$$l = 5x = 5 \times 20 = 100 \text{ m}$$

$$b = 3x = 3 \times 20 = 60 \text{ m}$$

$$\begin{aligned} \text{Area} &= l \times b \quad (\text{length} = 100\text{m, breath} = 60\text{m}) \\ &= 100 \times 60 \end{aligned}$$

$$\text{Area} = 6000 \text{ m}^2$$

Assignment

- Find the area of a rectangular plot whose sides are 24 metres and 20 metres respectively. Also find the perimeter of the plot.
- How many rectangular pieces of 5 cm x 4 cm will you get out of 65 cm x 30 cm brass sheet?
- Find its breadth and area if the perimeter of a rectangle is 400 metre and its length is 140 m.
- Find its area, if the opposite sides of a rectangle are 64 cm and 25 cm respectively.
- What is the width of the rectangle if a rectangle has an area of 224 cm² and length 16 cm.
- What is the length of the diagonal of a rectangle with sides 16 cm and 12 cm?
- Find the area of the rectangle if the perimeter of the rectangle is 100 cm and the ratio of its length and breadth is 3:2.

Parallelogram

This is also a four sided figure, opposite side being parallel to each other.

Area of parallelogram = base x height

$$\text{or} = 2x\sqrt{s(s-a)(s-b)(s-c)}$$

Where

$$s = \frac{a+b+c}{2}$$

a and b are adjacent sides.

$$P = 2(a+b)$$

Examples

- 1 The base and height of a parallelogram are 7.1 cm and 2.85 cm. Calculate its area.

$$\begin{aligned} A &= \text{base} \times \text{height units}^2 \\ &= 7.1 \times 2.85 \\ &= \mathbf{20.235 \text{ cm}^2} \end{aligned}$$

- 2 Find the height of a parallelogram whose area is 20 cm² and base is 10 cm.

$$\begin{aligned} A &= \text{base} \times \text{height units}^2 \\ h &= \frac{\text{area}}{\text{base}} \\ &= \frac{20}{10} \\ &= \mathbf{2 \text{ cm}} \end{aligned}$$

3. Two sides of a parallelogram are 12 cm and 8 cm. The diagonal is 10 cm long. Find the area of the parallelogram.

$$\begin{aligned} \text{Area } A &= 2x\sqrt{s(s-a)(s-b)(s-c)} \text{ units}^2 \\ s &= \frac{a+b+c}{2} \\ &= \frac{12+8+10}{2} \\ &= \frac{30}{2} \\ &= 15 \end{aligned}$$

$$\begin{aligned} A &= 2x\sqrt{15(15-12)(15-8)(15-10)} \\ &= 2x\sqrt{15 \times 3 \times 7 \times 5} \\ &= 2x\sqrt{1575} \\ &= 2 \times 39.686 \end{aligned}$$

$$\text{Area } A = 79.37 \text{ cm}^2$$

Assignment

- Find the area of a parallelogram, if its base and height are 8.1 cm and 30.8 cm respectively.
- Find the area of a parallelogram, if the sides of a field in the shape of parallelogram are 12 m and 17 m and one of the diagonal is 25 m.
- Find the base of a parallelogram whose height is 12 cm and area is 120 cm².
- Find the height of a parallelogram whose base is 40 cm and area is 320 cm².
- Find the area of the land if the sides of a land in the shape of a parallelogram are 24 m and 28 m respectively and one of the diagonal is 30 m.
- What is the perimeter of parallelogram if base is 10 cm and other side is 5 cm?
- Find the area of parallelogram if its base and height are 25 cm and 12 cm.
- Find the base of a parallelogram if height is 15 cm and area is 150 cm².
- Find the height of a parallelogram if base is 80 cm and area is 640 cm².
- Find the area of parallelogram if its base and height are 15 cm and 8 cm.
- Calculate the perimeter and area of parallelogram if base, height are 12.7 cm, 5.5 cm and other side is 6.5 cm.
- Find the height of parallelogram if the area is 20 cm² and base is 10 cm.

Mensuration - Area and perimeter of triangles

Triangles

Tri means three. Hence tri- angle means three angled figure. For construction of three angled figure, there should be three sides. Hence triangle means three sided figure. Sum of the three angles of any triangle = 180°.

i Any triangle.

Area of any triangle = $\frac{1}{2}$ x Base x Height unit²

ii Isosceles Triangle

In this triangle two of its sides are equal.

Area of isosceles triangle = $\frac{1}{2}$ x Base x Height

Where

base = 2.b

s = One of equal sides (or) Slant height

h = Height = $\sqrt{s^2 - b^2}$

Area of isosceles triangle = $\frac{1}{2}$ x 2b x $\sqrt{s^2 - b^2}$

= b . $\sqrt{s^2 - b^2}$ unit²

(Where b= half of base)

(or) Area of Isosceles triangle = $\frac{1}{4}$ b $\sqrt{4a^2 - b^2}$ unit²

a = Equal sides

b = Base

iii Equilateral triangle

In this triangle all the three sides are equal. Hence angle between adjacent sides is 60° (Three angles total = 180°)

angle between sides = $\frac{180}{3} = 60^\circ$

Area of equilateral triangle = $\frac{\sqrt{3}}{4}$ x side²

= $\frac{\sqrt{3}}{4}$ x a² unit²

Where $\sqrt{3} = 1.732$

Perimeter P = 3a unit

P = $\frac{\sqrt{3}}{2}$ a unit

iv Scalene triangle

In this triangle the sides are not equal. Angles between the sides, are also not equal. we may also call this triangle as irregular triangle.

Area of triangle = $\sqrt{s(s-a)(s-b)(s-c)}$ unit²

where

a,b,c are sides of triangle

s = Semi perimeter = $\frac{a+b+c}{2}$ unit

v Right angled triangle

In this triangle, angle between one of two adjacent sides is 90°. Right angle means 90°. That's why right angled triangle means, one of the angles of this triangle is definitely 90°.

Area of right angled triangle

= $\frac{1}{2}$ x Base x Height

= $\frac{1}{2}$ bh unit²

Hypotenuse = $\sqrt{\text{Base}^2 + \text{Height}^2}$

Where hypotenuse means, the diagonal or largest length of the side of right angled triangle.

Examples

- 1 Calculate its area if the base and height of a Right angled triangle are 10 cm and 3.5 cm respectively.

Base (b) = 10 cm

Height (h) = 3.5 cm

Area (A) = ?

$$A = \frac{1}{2} \times b \times h$$

$$= \frac{1}{2} \times 10 \times 3.5$$

$$= 17.5 \text{ cm}^2$$

- 2 Calculate the base of a triangle having an area of 15 cm² and height is 3.5 cm.

Area (A) = 15 cm²

Height (h) = 3.5 cm

Base (b) = ?

$$\frac{1}{2} \times b \times h = A$$

$$\frac{1}{2} \times b \times 3.5 = 15$$

$$b = \frac{15 \times 2}{3.5}$$

$$= 8.57 \text{ cm}$$

- 3 Calculate the height of a triangle whose area is 60 cm² and base is 10 cm.

Area (A) = 60 cm²

Base (B) = 10 cm

Height (h) = ?

$$\frac{1}{2} \times b \times h = A$$

$$\frac{1}{2} \times 10 \times h = 60$$

$$h = \frac{60 \times 2}{10}$$

height h = 12 cm

- 4 Find the area of an isosceles triangle whose base is 6 cm long and each of the other two sides 5 cm long.

Base (b) = 6 cm = $\frac{6}{2} = 3 \text{ cm}$

Equal sides or slant height 's' = 5 cm

Area (A) = ?

$$A = b \times \sqrt{s^2 - b^2}$$

$$= 3 \times \sqrt{5^2 - 3^2}$$

$$= 3 \times \sqrt{25 - 9}$$

$$= 3 \times \sqrt{16}$$

$$= 3 \times 4$$

$$= 12 \text{ cm}^2$$

or

$$A = \frac{1}{4} b \sqrt{4a^2 - b^2}$$

$$= \frac{1}{4} \times 6 \sqrt{4 \times 5^2 - 6^2}$$

$$= \frac{1}{4} \times 6 \times 8$$

$$= 12 \text{ cm}^2$$

- 5 Find its height if an isosceles triangle has base of 200 mm and its area is 2000 mm².

Base = 200 mm

Area = 2000 mm²

h = ?

$$\frac{1}{2} \times b \times h = A$$

$$\frac{1}{2} \times 200 \times h = 2000$$

$$h = \frac{2000 \times 2}{200} = 20 \text{ mm}$$

- 6 Find the area of an equilateral triangle whose side is 5 cm.

$$\begin{aligned} \text{Area} &= \frac{\sqrt{3}}{4} a^2 \text{ unit}^2 \\ &= \frac{1.732}{4} \times 5 \times 5 \\ &= \mathbf{10.825 \text{ cm}^2} \end{aligned}$$

- 7 Calculate its perimeter if one side of an equilateral triangle is 55 mm long.

$$\begin{aligned} \text{Side} &= 55 \text{ mm} \\ \text{Perimeter (P)} &= ? \\ P &= 3a \text{ unit} \\ &= 3 \times 55 \\ &= \mathbf{165 \text{ mm}} \end{aligned}$$

- 8 Find the area of the triangle having its sides are 9cm, 10cm and 12 cm.

$$\begin{aligned} \text{Semi Perimeter} &= \frac{a+b+c}{2} \text{ unit} \\ &= \frac{9+10+12}{2} = \frac{31}{2} \\ &= 15.5 \text{ cm} \\ \text{Area A} &= \sqrt{s(s-a)(s-b)(s-c)} \text{ unit}^2 \\ &= \sqrt{15.5(15.5-9)(15.5-10)(15.5-12)} \\ &= \sqrt{15.5 \times 6.5 \times 5.5 \times 3.5} \\ &= \sqrt{1939.4375} \\ &= \mathbf{44.03 \text{ cm}^2} \end{aligned}$$

- 9 Find the cost of polishing on both sides of a triangular metal plate has sides 60 cm, 50 cm and 20 cm at the rate of Rs.1.35 per 100 cm²

$$\text{Semi Perimeter} = \frac{a+b+c}{2} \text{ unit}$$

$$= \frac{60+50+20}{2} = \frac{130}{2}$$

$$= 65 \text{ cm}$$

$$\text{Area A} = \sqrt{s(s-a)(s-b)(s-c)} \text{ unit}^2$$

$$= \sqrt{65(65-60)(65-50)(65-20)}$$

$$= \sqrt{65 \times 5 \times 15 \times 45}$$

$$= \mathbf{468.4 \text{ cm}^2}$$

$$\text{Area of polish on both sides} = 2 \times 468.4$$

$$= 936.8 \text{ cm}^2$$

$$\text{Cost of polish per 100 cm}^2 = \text{Rs. } 1.35$$

$$\therefore \text{Cost of polish is } 936.8 \text{ cm}^2 = \frac{936.8}{100} \times 1.35$$

$$= \text{Rs. } 12.65$$

- 10 Find the area of the right angled triangle with base 20 cm and height 8 cm.

$$\text{Base b} = 20 \text{ cm}$$

$$\text{Equal sides or slant height} = 8 \text{ cm}$$

$$\text{Area (A)} = ?$$

$$\text{Area (A)} = \frac{1}{2} \times \text{base} \times \text{height unit}^2$$

$$= \frac{1}{2} \times 20 \times 8$$

$$= \mathbf{80 \text{ cm}^2}$$

- 11 Find the area of the right angled triangle if the sides containing the right angle being 10.5 cm and 8.2 cm.

$$\text{Area (A)} = \frac{1}{2} \times \text{base} \times \text{height unit}^2$$

$$= \frac{1}{2} \times 10.5 \times 8.2$$

$$= \mathbf{43.05 \text{ cm}^2}$$

- 12 Calculate the perpendicular height of the triangle if the area of the right angled triangle is 19.44 m² and its one of the adjacent side containing the right angle being 5.4 m.

$$\frac{1}{2} \times \text{base} \times \text{height unit}^2 = \text{Area}$$

$$\frac{1}{2} \times 5.4 \times h = 19.44$$

$$h = \frac{19.44 \times 2}{5.4}$$

$$= 7.2 \text{ m}$$

13 Calculate the base of a right angled triangle having an area of 12.5 cm^2 . If its height is 2.5 cm .

$$\frac{1}{2} \times \text{base} \times \text{height unit}^2 = \text{Area}$$

$$\frac{1}{2} \times b \times 2.5 = 12.5$$

$$b = \frac{12.5 \times 2}{2.5}$$

$$= 10 \text{ cm}$$

Pythagoras theorem

In a right angled triangle the area of the square drawn with the hypotenuse as the side is equal to the sum of the areas of the squares drawn with the other two sides.

$$\angle B = 90^\circ$$

AC = Hypotenuse

AB & BC = Adjacent sides

As per pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

$$\therefore AC = \sqrt{AB^2 + BC^2}$$

1 Calculate the hypotenuse of a right angled triangle whose base is 5 cm and height is 12 cm .

As per pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

$$= 12^2 + 5^2$$

$$= 144 + 25$$

$$= 169$$

$$AC = \sqrt{169}$$

$$= 13 \text{ cm}$$

2 What is the length of the hypotenuse of a right angled triangle, when the sides containing the right angles are 10 cm and 12 cm .

As per pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

$$= 10^2 + 12^2$$

$$= 100 + 144$$

$$= 244$$

$$AC = \sqrt{244}$$

$$= 15.62 \text{ cm}$$

3 Find the height of a right angled triangle whose base is 15 cm and hypotenuse is 21 cm .

As per pythagoras theorem,

$$AB^2 + BC^2 = AC^2$$

$$AB^2 + 15^2 = 21^2$$

$$AB^2 = 441 - 225$$

$$= 216$$

$$AB = \sqrt{216}$$

$$= 14.7 \text{ cm}$$

Mensuration - Area and perimeter of circle, semi-circle, circular ring, sector of circle, hexagon and ellipse

Circle

It is the path of a point which is always equal from its centre is called a circle.

r = radius of the circle

d = diameter of the circle

$$\pi = \frac{22}{7} = 3.14$$

Area of the circle = πr^2

(or)
$$= \frac{\pi}{4} d^2 \text{ unit}^2$$

Circumference of the circle $2\pi r$ (or) πd unit

Examples

- 1 Find the area of a circle whose radius is 1.54 m. Also find its circumference.

radius r = 1.54 m

Area A = ?

Circumference C = ?

$$A = \pi r^2 \text{ unit}^2$$

$$= \frac{22}{7} \times 1.54 \times 1.54$$

$$= 7.4536 \text{ m}^2$$

$$C = 2\pi r \text{ unit}$$

$$= 2 \times \frac{22}{7} \times 1.54$$

$$= 9.68 \text{ m}$$

- 2 Find out the circumference if the area of a circular shape of land is 616 m^2 .

$$A = \pi r^2 \text{ unit}^2$$

$$r^2 = \frac{616}{\pi}$$

$$= \frac{616 \times 7}{22}$$

$$= 196$$

$$r = \sqrt{196}$$

$$= 14 \text{ m}$$

Circumference = $2\pi r$ unit

$$= 2 \times \frac{22}{7} \times 14$$

$$= 88 \text{ m}$$

- 3 Find the side of square into which it can be bent if a wire is in the form of a circle of radius 49 cm.

radius of circle r = 49 cm

side of square = ?

Perimeter of the square = Perimeter of the circle

$$4a = 2\pi r$$

$$4a = 2 \times \frac{22}{7} \times 49$$

$$4a = 308$$

$$a = \frac{308}{4}$$

$$= 77 \text{ cm}$$

- 4 Find its radius if the difference between the circumference and diameter of a circle is 28 cm.

Circumference - Diameter = 28 cm

$$2\pi r - d = 28$$

$$2\pi r - 2r = 28$$

$$2r(\pi - 1) = 28$$

$$2r \left(\frac{22}{7} - 1 \right) = 28$$

$$2r \left(\frac{22-7}{7} \right) = 28$$

$$2r \times \frac{15}{7} = 28$$

$$r = \frac{28 \times 7}{15 \times 2}$$

$$= 6.53 \text{ cm}$$

- 5 What is the side of the largest square cut out from a circle of 50 cm dia.?

Diagonal of a square = Diameter of the circle

$$\sqrt{2}a = 50$$

$$a = \frac{50}{\sqrt{2}}$$

$$= \frac{50}{1.414}$$

$$= \mathbf{35.36 \text{ cm}}$$

$$= \frac{1}{2} \times 50 \times 16 \text{ cm}^2$$

$$= 400 \text{ cm}^2$$

$$\text{Area of Semi circle} = \frac{\pi r^2}{2} \text{ unit}^2$$

$$= \pi \times 15^2 \times \frac{1}{2} \text{ cm}^2$$

$$= 353.57 \text{ cm}^2$$

$$\text{Total area of the figure} = 500 + 400 + 353.57$$

$$= \mathbf{1253.57 \text{ cm}^2}$$

- 6 Calculate the area of the figure given below.

$$\begin{aligned} \text{Area of rectangle} &= lb \text{ unit}^2 \\ &= 25 \times 20 \text{ cm}^2 \\ &= 500 \text{ cm}^2 \end{aligned}$$

$$\begin{aligned} \text{Area of Trapezium} &= \frac{1}{2} \times (a + b) h \\ &= \frac{1}{2} \times (30 + 20) 16 \text{ cm}^2 \end{aligned}$$

- 7 Find the area of remaining steel plate if in a rectangular steel plate 16 cm x 12 cm, there are 6 holes each 4 cm in diameter.

Area of a rectangular plate = length x breadth unit²

$$= 16 \times 12$$

$$= 192 \text{ cm}^2$$

$$\text{No. of holes} = 6$$

$$\text{Radius of hole} = 2 \text{ cm}$$

$$\text{Area of 6 holes} = 6 \times \pi r^2 \text{ unit}^2$$

$$= 6 \times \frac{22}{7} \times 2 \times 2 \text{ unit}^2$$

$$= 75.43 \text{ cm}^2$$

$$\text{Area of remaining plate} = 192 - 75.43$$

$$= \mathbf{116.57 \text{ cm}^2}$$

Semi circle

A semi circle is a sector whose central angle is 180°.
Length of arc of semi circle.

$$\begin{aligned} \text{Length of arc } l &= 2\pi r \times \frac{180}{360} \\ &= 2\pi r \times \frac{1}{2} = \pi r \text{ unit} \end{aligned}$$

$$\text{Area of semi circle} = \frac{\pi r^2}{2} \text{ Sq. units}$$

$$\begin{aligned} \text{Perimeter of a semi circle} &= \frac{2\pi r}{2} + 2r \\ &= \pi r + 2r \\ &= r(\pi + 2) \text{ unit} \end{aligned}$$

Examples

- 1 Calculate the circumference and area of a semi circle whose radius is 6 cm.

$$\text{radius } r = 6 \text{ cm}$$

$$\text{Area } A = ?$$

$$\text{Circumference } c = ?$$

$$A = \frac{\pi r^2}{2} \text{ unit}^2$$

$$= \frac{22}{7} \times \frac{1}{2} \times 6^2$$

$$\text{Area (A)} = \frac{22}{7} \times \frac{1}{2} \times 36$$

$$= \frac{396}{7} = 56.57 \text{ cm}^2$$

$$\text{Perimeter of a semicircle} = \frac{2\pi r}{2} + 2r = \pi r + 2r$$

$$\begin{aligned}
 &= r(\pi + 2) = 6 \left(\frac{22}{7} + 2 \right) \\
 &= 6 \left(\frac{22 + 14}{7} \right) \\
 &= 6 \times \frac{36}{7} \\
 &= \frac{216}{7} \\
 &= \mathbf{30.86 \text{ cm}}
 \end{aligned}$$

- 2 From the figure given below ABCD is a steel plate, a semi circular plate of radius 50 mm has been prepared by gas cutting. Find the waste area.

Plate length AB	= 100 mm
Breadth BC	= 50 mm
Radius	= 50 mm

Waste area = Plate area - Area of semi circle

$$\begin{aligned}
 &= lb - \frac{\pi r^2}{2} \\
 &= 100 \times 50 - \frac{22 \times 50 \times 50}{7 \times 2} \\
 &= 5000 - 3928.57 \\
 &= \mathbf{1071.43 \text{ mm}^2}
 \end{aligned}$$

Circular ring

R = Outer radius of circular ring

r = Inner radius of circular ring

Area of circular ring = $\pi (R^2 - r^2)$ unit²

or

A = $\pi (R + r) (R - r)$ unit²

- 1 Calculate the area of cross section of pipe having outside dia of 17 cm and inside dia of 14 cm.

Given:

Outer dia of pipe = 17 cm

Outer radius of pipe (R) = $\frac{17}{2} = 8.5 \text{ cm}$

Inner dia of pipe = 14 cm

Inner radius of pipe (r) = $\frac{14}{2} = 7 \text{ cm}$

To find:

Area of cross section of pipe = ?

Solution:

$$\begin{aligned}
 \text{Area of cross section of pipe} &= \pi (R + r) (R - r) \text{ unit}^2 \\
 &= \pi (8.5 + 7) (8.5 - 7) \\
 &= \frac{22}{7} \times 15.5 \times 1.5 \text{ cm}^2 \\
 &= \mathbf{73 \text{ cm}^2}
 \end{aligned}$$

- 2 Find the distance between the boundaries and the area of the circular ring, if the circumference of two concentric circle are 134 cm and 90 cm.

Given:

Circumference of outer circle = 134 cm

Circumference of inner circle = 90 cm

To find:

Distance between the circles = ?

Area of circular ring = ?

Solution:

Circumference of outer circle = 134 cm

$$2\pi R = 134 \text{ cm}$$

$$R = \frac{134}{2\pi} = 21.32 \text{ cm}$$

Circumference of inner circle = 90 cm

$$2\pi r = 90 \text{ cm}$$

$$r = \frac{90}{2\pi} = 14.32 \text{ cm}$$

Distance between the circle = R - r

$$= 21.32 - 14.32 \text{ cm}$$

$$= 7 \text{ cm}$$

Area of circular ring = $\pi (R + r) (R - r)$ unit²

$$= \pi (21.32 + 14.32) (21.32 - 14.32) \text{ cm}^2$$

$$= \frac{22}{7} \times 35.64 \times 7 \text{ cm}^2$$

$$= \mathbf{784.08 \text{ cm}^2}$$

3 A wire can be bend in the form of a circle of radius 56 cm. If it is bend in a form of a square, find the side.

Given:

$$\text{Radius of circle} = 56 \text{ cm}$$

To find:

$$\text{Side of square} = ?$$

Solution:

$$\text{Radius of circle} = 56 \text{ cm}$$

$$\text{Circumference of circle} = 2\pi r \text{ unit} = 2\pi \times 56 \text{ cm}$$

$$\text{Side of square} = x \text{ cm}$$

Wire can be bend from the form of round to square

$$\text{Perimeter of square} = \text{circumference of circle}$$

$$4 \times a = 352 \text{ cm}$$

$$a = \frac{352}{4} = 88 \text{ cm}$$

Sector of Circle

θ = Angle of sector of circle

l = Arc length

r = radius

$$\text{Length of Arc } l = \frac{\theta}{360^\circ} \times 2\pi r \text{ unit}$$

$$\text{Perimeter } P = 2r + l \text{ unit}$$

$$\text{Area} = \frac{\theta}{360^\circ} \times \pi r^2 \text{ unit}^2 \quad (\text{or}) \quad A = \frac{l r}{2} \text{ unit}^2$$

1 Find the perimeter and area of a sector of circle of radius 7 cm and its angle is 120° .

Given:

$$\text{Angle of sector of circle} = 120^\circ$$

$$\text{Radius} = 7 \text{ cm}$$

To find:

$$\text{Perimeter} = ? , \text{Area} = ?$$

Solution:

$$\begin{aligned} \text{Length of arc } (l) &= \frac{\theta}{360^\circ} \times 2\pi r \text{ unit} \\ &= \frac{120}{360} \times 2 \times \frac{22}{7} \times 7 \text{ cm} \\ &= 14.67 \text{ cm} \end{aligned}$$

$$\begin{aligned} \text{Perimeter} &= 2r + l \text{ unit} \\ &= 2 \times 7 + 14.67 \text{ cm} \\ &= 28.67 \text{ cm} \end{aligned}$$

$$\text{Area} = \frac{\theta}{360^\circ} \times \pi r^2 \text{ unit}^2$$

$$\text{Area} = \frac{120^\circ}{360^\circ} \times \frac{22}{7} \times 7 \text{ cm}^2 = 51.33 \text{ cm}^2$$

2 Find the radius of the circle if the angle is 60° and the area of a sector of a circle is 144 cm^2 ,

Given:

$$\text{Area of sector of circle } (A) = 144 \text{ cm}^2$$

$$\text{Angle of sector of circle } \theta = 60^\circ$$

To find:

$$\text{Radius of circle} = ?$$

Solution:

$$\begin{aligned} \text{Area } (A) &= \frac{\theta}{360^\circ} \times \pi r^2 \text{ unit}^2 \\ 144 &= \frac{60^\circ}{360^\circ} \times \frac{22}{7} \times r^2 \text{ cm}^2 \\ r^2 &= 274.91 \text{ cm}^2 \\ r &= \sqrt{274.91} = 16.58 \text{ cm} \end{aligned}$$

3 Find the area of the sector whose angle is 105° , and the perimeter of sector of circle is 18.6 cm.

Given:

$$\text{Perimeter of a sector of a circle} = 18.6 \text{ cm}$$

$$\text{Angle of sector of circle} = 105^\circ$$

To find:

$$\text{Area} = ?$$

Solution:

$$\begin{aligned} \text{Length of Arc } (l) &= \frac{\theta}{360^\circ} \times 2\pi r \text{ unit} \\ l &= \frac{105^\circ}{360^\circ} \times 2 \times \frac{22}{7} \times r \\ &= 1.83r \end{aligned}$$

$$\begin{aligned} \text{Perimeter } (P) &= l + 2r \text{ unit} \\ 18.6 &= 1.83r + 2r \\ 3.83r &= 18.6 \text{ cm} \end{aligned}$$

$$r = \frac{18.6}{3.83} = 4.86 \text{ cm}$$

$$\begin{aligned} \text{Area A} &= \frac{\theta}{360^\circ} \times \pi r^2 \text{ unit}^2 \\ &= \frac{105^\circ}{360^\circ} \times \frac{22}{7} \times (4.86) \text{ cm}^2 \\ &= 21.65 \text{ cm}^2 \end{aligned}$$

4 Find the area, if the radius is 12.4 cm and the perimeter of a sector of a circle is 64.8 cm.

Given:

$$\text{Perimeter P} = 64.8 \text{ cm}$$

$$\text{Radius r} = 12.4 \text{ cm}$$

To find:

$$\text{Area A} = ?$$

Solution:

$$\text{Perimeter P} = l + 2r \text{ unit}$$

$$l = P - 2r \text{ unit}$$

$$= 64.8 - 2(12.4) \text{ cm}$$

$$= 64.8 - 24.8 = 40 \text{ cm}$$

$$\text{Area A} = \frac{lr}{2} \text{ unit}^2 = \frac{40 \times 12.4}{2}$$

$$= 248 \text{ cm}^2$$

5 Find out the length of the belt, if the arrangement of a belt is shown in the figure below.

Solution:

$$\text{Length } l_A = \frac{\theta}{360^\circ} \times 2\pi r \text{ unit}$$

$$= \frac{210^\circ}{360^\circ} \times 2 \times \frac{22}{7} \times 30 = 110 \text{ cm}$$

$$\text{Length } l_B = \frac{\theta}{360^\circ} \times 2\pi r \text{ unit}$$

$$= \frac{105^\circ}{360^\circ} \times 2 \times \frac{22}{7} \times 5 = 91.7 \text{ cm}$$

$$= l_A + l_B + 2 \times 214 \text{ cm}$$

$$= 110 + 91.7 + 428 \text{ cm}$$

$$= 547.17 \text{ cm}$$

Hexagon

Side = a unit

Perimeter P = 6a unit

Area A = $6 \times \frac{\sqrt{3}}{4} \times a^2$ units² (Area of 6 equilateral triangle)

DAF (Distance Across Flats) = $\sqrt{3} \times a$ unit

DAC (Distance Across Corners) = 2 x a unit

1 Find out the perimeter, area, DAF and DAC of a regular hexagon whose side is 2cm.

(DAF - Distance Across Flats)

(DAC - Distance Across Corners)

Given: Side of hexagon (a) = 2cm

To Find: P = ?, A = ?, DAF = ?, DAC = ?

Solution:

Perimeter of hexagon (P) = 6a unit

$$= 6a \text{ unit} = 6 \times 2 \text{ cm} = 12 \text{ cm}$$

Area of hexagon A = $6 \times \frac{\sqrt{3}}{4} \times a^2$ unit²

$$= 6 \times \frac{1.732}{4} \times 2^2$$

$$= 10.392 \text{ cm}^2$$

DAF (Distance Across

Flats) = $\sqrt{3} \times a$ unit

$$= \sqrt{3} \times 2 = 1.732 \times 2$$

$$= 3.464 \text{ cm}$$

DAC (Distance Across

Corners) = 2 x a unit

$$= 2 \times 2 = 4 \text{ cm}$$

Ellipse

Major axis $AB = 2a$

Half of Major axis $OB = a$,

Minor axis $CD = 2b$

Half of Minor axis $OC = b$

Area of ellipse $A = \pi \times a \times b \text{ unit}^2$

Perimeter of ellipse $P = 2\pi \sqrt{\frac{a^2 + b^2}{2}} \text{ unit}$

- 1 Find its area and perimeter, if the major and minor axis of an ellipse are 12 cm and 8 cm respectively.

Solution:

$$\text{Major axis } 2a = 12 \text{ cm}$$

$$a = \frac{12}{2} = 6 \text{ cm}$$

$$\text{Minor axis } 2b = 8 \text{ cm}$$

$$b = \frac{8}{2} = 4 \text{ cm}$$

$$\text{Area } A = \pi \times a \times b \text{ unit}^2$$

$$= \frac{22}{7} \times 6 \times 4 \text{ cm}^2$$

$$= 75.43 \text{ cm}^2$$

$$\text{Perimeter (P)} = 2\pi \sqrt{\frac{a^2 + b^2}{2}} \text{ unit}$$

$$= 2 \times \frac{22}{7} \sqrt{\frac{6^2 + 4^2}{2}} \text{ unit}$$

$$= 2 \times \frac{22}{7} \sqrt{\frac{36 + 16}{2}} \text{ unit}$$

$$= 2 \times \frac{22}{7} \times \sqrt{26}$$

$$= 2 \times \frac{22}{7} \times 5.1 = 32.06 \text{ cm}$$

Assignment

Circle

- 1 Find the circumference and area of a circle whose radius is 10 metre.
- 2 Find its diameter if the area of a circle is 330 cm^2 .
- 3 Find its area if the circumference of a circle is 50 cm.
- 4 Find out the area and circumference of a circle of diameter is 50 cm.
- 5 Find its area if the circumference of a circle is 44 cm.

Semi circle

- 1 Calculate the circumference and area of semi circle whose radius is 14 cm.
- 2 Find area of the given figure.

Circular ring

- 1 Find out area of a ring washer, whose inner radius and outer radius are 13 cm and 15 cm respectively.
- 2 Find the area of a ring portion of a washer whose outer dis is 30 m and inner dis is 20 m. Also calculate the difference between the circumference of circles.

Sector of circle

- 1 Find the perimeter and area of a sector of a circle of radius 5cm and its angle is 96° .
- 2 Find the radius of the circle if the angle is 90° and the area of sector of a circle is 196 cm^2 .

Hexagon

- 1 Find out the Area, perimeter, DAF, and DAC of hexagon of side 4cm.
- 2 Find the area of cross section of a regular hexagon rod whose side is 7.5 cm.

Ellipse

- 1 Find the area of the biggest ellipse that can be inscribed in a rectangle of length 18 cm and breadth 12 cm. Also calculate its perimeter.
- 2 How much fencing will be required to enclose an elliptical plot of ground the axes of the ellipse being 200 and 170 meter respectively.

Workshop Calculation & Science - Electrician - Power Distribution Exercise 1.8.31

Mensuration - Surface area and volume of solids - cube, cuboid, cylinder, sphere and hollow cylinder

Cube

All sides of cube are same i.e length, breadth and height have same value. It is bounded by six equal square faces.

$$\begin{aligned} \text{Volume of cube} &= \text{side} \times \text{side} \times \text{side} \\ &= a^3 \text{ unit}^3 \end{aligned}$$

$$\text{Lateral surface area} = 4a^2 \text{ unit}^2$$

$$\begin{aligned} \text{Total surface area} &= 6 \times \text{side} \times \text{side} \\ &= 6a^2 \text{ unit}^2 \end{aligned} \quad \sqrt{3} = 1.732$$

$$\text{Diagonal } d = \sqrt{3}a$$

Rectangular solid (or) cuboid

Rectangular solid is bounded by six rectangular surfaces and opposite surfaces are equal and parallel to each other.

$$\begin{aligned} \text{Volume of rectangular solid} &= \text{Length} \times \text{breadth} \times \text{height} \\ &= l \cdot b \cdot h \text{ unit}^3 \end{aligned}$$

$$\text{Lateral surface area} = 2h(l+b) \text{ unit}^2$$

$$\begin{aligned} \text{Total surface area} &= 2lb + 2bh + 2hl \\ &= 2(lb+bh+hl) \text{ unit}^2 \end{aligned}$$

l = length, b = breadth and h = height

Cylinder

This is a prism whose top and bottom surfaces are equal and circular.

$$\text{Volume of cylinder} = \pi r^2 h \quad \text{or} \quad \frac{\pi}{4} d^2 h$$

$$\text{Curved area of cylinder} = 2\pi r h \text{ unit}^2$$

$$\text{Total surface area of cylinder} = 2\pi r(h+r) \text{ unit}^2$$

r = Radius of base, d = Diameter of base

h = Height of cylinder

Hollow cylinder

Hollow means empty space. In hollow cylinder there is an empty place. Water pipe is an example of hollow cylinder.

$$\begin{aligned} \text{Volume of hollow cylinder} &= \pi (R^2 - r^2) h \text{ (or)} \\ &= \pi (R + r) (R - r) h \text{ (or)} \\ &= \frac{\pi}{4} (D^2 - d^2) h \text{ unit}^3 \\ &= \frac{\pi}{4} (D + d)(D - d) h \end{aligned}$$

Total surface area of hollow cylinder =

Inner + outer curved area + area of top and bottom circular part

$$\text{TSA} : 2\pi R h + 2\pi r h + 2\pi(R^2 - r^2)$$

R = outer radius
 r = inner radius
 D = outer diameter
 d = inner diameter
 h = height of cylinder
 t = thickness

$$\text{Mean dia} = \frac{D-d}{2}$$

If thickness given then:

Volume of hollow cylinder = $\pi \times \text{mean dia} \times \text{thickness} \times \text{height}$

Finding out volumes of solids

The space occupied by a body is known its volume. The volume of a body indicates the capacity to hold substance in it.

The general form of Lateral surface area Total surface area and Volume is :

Lateral surface area = perimeter of the base x height

Total surface area = LSA + 2 (base area)

Volume = Area of base x height

Important and commonly used solids are described below one after another:

Cube

1 Find the diagonal, lateral surface area,, total surface area and volume of a cube of side 4.5 cm.

$$\begin{aligned} \text{side } a &= 4.5 \text{ cm} \\ \text{diagonal } d &= \sqrt{3}a \text{ unit} \\ &= 1.732 \times 4.5 \\ &= 7.794 \text{ cm} \\ \text{L.S.A} &= 4a^2 \text{ unit}^2 \\ &= 4 \times 4.5 \times 4.5 \\ &= 81 \text{ cm}^2 \\ \text{T.S.A} &= 6a^2 \text{ unit} \\ &= 6 \times 4.5 \times 4.5 \\ &= 121.5 \text{ cm}^2 \\ V &= a^3 \text{ unit}^3 \\ &= 4.5 \times 4.5 \times 4.5 \\ &= \mathbf{91.125 \text{ cc.}} \end{aligned}$$

2 Calculate volume of a cube where side is 9 cm

$$\begin{aligned} a &= 9 \text{ cm} \\ V &= ? \\ V &= a^3 \\ &= 9 \times 9 \times 9 \\ &= \mathbf{729 \text{ cm}^3} \end{aligned}$$

3 Find out side of the cube if a cube has volume of 3375cm³.

$$\begin{aligned} V &= 3375 \text{ cm}^3 \\ a &= ? \\ a^3 &= 3375 \\ a &= \sqrt[3]{3375} \\ &= \sqrt{3 \times 3 \times 3 \times 5 \times 5 \times 5} \\ &= 3 \times 5 \\ &= \mathbf{15 \text{ cm}} \end{aligned}$$

4 Find the side of a cube, if its surface area is 216 cm²

Surface area = T.S.A = 216 cm²

$$\begin{aligned} 6a^2 &= 216 \\ a^2 &= \frac{216}{6} \\ &= 36 \\ a &= \sqrt{36} \\ &= 6 \text{ cm} \end{aligned}$$

5 Find the side of the square tank, if its height is 2 metre and has the capacity to hold 50,000 litre of water.

Height of square shape tank (h) = 2 m

$$\begin{aligned} \text{Capacity} &= 50,000 \text{ litre} \\ 1000 \text{ litre} &= 1 \text{ m}^3 \end{aligned}$$

$$\begin{aligned} 50,000 \text{ Litre} &= \frac{50000}{1000} \\ &= 50 \text{ m}^3 \end{aligned}$$

Capacity of tank = 50 m³

$$a^2 \times h = 50$$

$$a^2 \times 2 = 50$$

$$a^2 = \frac{50}{2} = 25 \text{ m}^2$$

$$a = \sqrt{25} = 5 \text{ m}$$

Side of the square tank = 5 m

Rectangular Solid (or) Cuboid

1 Find its volume and T.S.A if a tank is 20 m long, 15 m broad and 12 m high.

$$l = 20 \text{ m}$$

$$b = 15 \text{ m}$$

$$h = 12 \text{ m}$$

$$v = ?$$

$$\text{T.S.A} = ?$$

$$\begin{aligned} \text{Volume } v &= lbh \text{ unit}^3 \\ &= 20 \times 15 \times 12 \\ &= 3600 \text{ m}^3 \end{aligned}$$

$$\begin{aligned} \text{T.S.A} &= 2(lb + bh + hl) \text{ unit}^2 \\ &= 2((20 \times 15) + (15 \times 12) + (20 \times 12)) \\ &= 2(300 + 180 + 240) \\ &= \mathbf{1440 \text{ m}^2} \end{aligned}$$

- 2 Find out its height if the cross section is 260 mm length and 180 mm wide rectangular and the capacity of a fuel tank is 10500 cm³.

$$\begin{aligned} l &= 260\text{mm} = 26 \text{ cm} \\ b &= 180 \text{ mm} = 18 \text{ cm} \\ v &= 10500 \text{ cm}^3 \\ h &= ? \\ l.b.h &= \text{volume} \end{aligned}$$

$$26 \times 18 \times h = 10500$$

$$\begin{aligned} h &= \frac{10500}{26 \times 18} \\ &= \mathbf{22.44 \text{ cm}} \end{aligned}$$

- 3 How many litres of water it can store if a water tank has the following dimensions length = 1 metre, width = 0.8 metre and height = 1.2 metre?

$$\begin{aligned} \text{Volume} &= l \times b \times h \text{ unit}^3 \\ &= 1 \times 0.8 \times 1.2 \\ &= 0.96 \text{ m}^3 \quad [1 \text{ m}^3 = 1000 \text{ litres}] \\ &= 0.96 \times 1000 \end{aligned}$$

= 960 litres of water can store in the tank.

- 4 Find its volume if the base of a prism is a rectangle having 5m length, 4m breadth and the height of the prism is 15m.

The base of prism is rectangle

$$\begin{aligned} \text{Area of base} &= \text{length} \times \text{breadth} \\ &= 5 \times 4 \\ &= 20 \text{ square m} \end{aligned}$$

$$\begin{aligned} \text{Volume of prism} &= \text{Area of base} \times \text{Height} \\ &= 20 \times 15 \\ &= \mathbf{300 \text{ cm}^3} \end{aligned}$$

Cylinder

- 1 Find the volume and total surface are of a cylinder having 9cm diameter and 15 cm height.

$$\begin{aligned} \text{diameter} &= 9 \text{ cm} \\ \text{radius } r &= 4.5 \text{ cm} \\ \text{height } h &= 15 \text{ cm} \\ \text{Volume } V &= ? \\ \text{T.S.A} &= ? \end{aligned}$$

$$\begin{aligned} V &= \pi r^2 h \text{ unit}^3 \\ &= \frac{22}{7} \times 4.5 \times 4.5 \times 15 \\ &= 954.4 \text{ cm}^3 \end{aligned}$$

$$\begin{aligned} \text{T.S.A} &= 2\pi r(h+r) \text{ unit}^2 \\ &= 2 \times \frac{22}{7} \times 4.5 (15 + 4.5) \end{aligned}$$

$$\begin{aligned} &= 2 \times \frac{22}{7} \times 4.5 \times 19.5 \\ &= \mathbf{551.4 \text{ cm}^2} \end{aligned}$$

- 2 Calculate the radius if the curved surface area of a cylindrical roller is 48π cm² and the roller is 10 cm long

$$\begin{aligned} \text{C.S.A} &= 48\pi \text{ cm}^2 \\ \text{length} &= 10 \text{ cm} \\ \text{radius} &= ? \\ 2\pi rh &= 48\pi \\ 2 \times \pi \times r \times 10 &= 48\pi \\ r &= \frac{48 \times \pi}{2 \times \pi \times 10} \\ &= \mathbf{2.4 \text{ cm}} \end{aligned}$$

- 3 Find its radius if the volume of a cylinder is 5544 cm³ and its height is 16 cm.

$$\begin{aligned} \pi r^2 h &= v \\ 3.14 \times r^2 \times 16 &= 5544 \\ r^2 &= \frac{5544}{3.14 \times 16} \\ r^2 &= \frac{5544}{50.24} \\ &= 110.35 \\ r &= \sqrt{110.35} \\ &= \mathbf{10.5 \text{ cm}} \end{aligned}$$

- 4 Find the diameter of the tank if the volume of a circular tank is 68.46 m³, its height is 2 m.

$$\begin{aligned} \pi r^2 h &= 68.46 \\ r^2 &= \frac{68.46}{3.14 \times 2} \\ r^2 &= 10.9 \\ r &= \sqrt{10.9} \\ &= 3.3 \text{ m} \\ \text{diameter} &= 2r \\ &= 2 \times 3.3 \\ &= \mathbf{6.6 \text{ m}} \end{aligned}$$

- 5 A cylindrical vessel is to be made of 3 metre long and 1.9994 metre diameter. Calculate its total surface area, if it is in a closed form on one end.

$$\begin{aligned} h &= 3\text{m} \\ d &= 1.9994\text{ m} \\ r &= 0.9997\text{ m} \end{aligned}$$

$$\begin{aligned} \text{T.S.A} &= \text{C.S.A} + \text{Base area} \\ &= 2\pi rh + \pi r^2 \\ &= \left(2 \times \frac{22}{7} \times 0.9997 \times 3\right) + \left(\frac{22}{7} \times 0.9997^2\right) \\ &= 18.85 + 3.14 \\ &= \mathbf{21.99\text{ m}^2} \end{aligned}$$

- 6 How many litres of water a cylinder of radius 75 cm and height 100 cm can hold.

$$\begin{aligned} V &= \pi r^2 h \text{ unit}^3 \\ &= 3.142 \times 75 \times 75 \times 100 \\ &= 1767375 \text{ cm}^3 \\ &= \frac{1767375}{1000} \quad [1000 \text{ cc} = 1 \text{ litre}] \\ &= \mathbf{1767.375 \text{ litres.}} \end{aligned}$$

- 7 Calculate the height of cylindrical tin if a closed rectangular box 40 cm long, 30 cm wide and 25 cm deep has the same volume as that of cylinder tin of radius 17.5 cm.

$$\begin{aligned} \text{Volume of cylinder} &= \text{Volume of rectangular box} \\ \pi r^2 h &= l \times b \times h \end{aligned}$$

$$\frac{22}{7} \times 17.5 \times 17.5 \times h = 40 \times 30 \times 25$$

$$\begin{aligned} h &= \frac{40 \times 30 \times 25 \times 7}{22 \times 17.5 \times 17.5} \\ &= \frac{210000}{6737.5} \\ &= \mathbf{31.17\text{ cm}} \end{aligned}$$

- 8 An oxygen cylinder is 15 cm in diameter and 100 cm in length. It is filled with gas under pressure so that every cm^3 of the cylinder contains 120 cm^3 of gas. How much cc of oxygen does this hold?

$$\begin{aligned} \text{Volume of cylinder} &= \pi r^2 h \text{ unit}^3 \\ &= \frac{22}{7} \times 7.5 \times 7.5 \times 100 \\ &= 17678.57 \text{ cm}^3 \end{aligned}$$

Gas contain in $1 \text{ cm}^3 = 120 \text{ cm}^3$ of gas

$$\begin{aligned} \text{Gas contain in } 17678.57 \text{ cm}^3 &= 17678.57 \times 120 \\ &= 2121428 \text{ cm}^3 \end{aligned}$$

Volume of oxygen = 2121428 cc.

Sphere

Sphere is a solid circular body.

$$\begin{aligned} \text{Volume of sphere} &= \frac{4}{3} \pi r^3 \quad \text{or} \\ &= \frac{\pi}{6} d^3 \text{ unit}^3 \end{aligned}$$

$$\text{Total surface area of sphere} = 4\pi r^2 \text{ unit}^2$$

Where r = Radius of sphere

d = Diametre of sphere

$$\text{Radius} = \frac{1}{2} \text{ of diameter}$$

- 1 Find the volume and surface area of a sphere of 3 cm radius.

$$\begin{aligned} V &= \frac{4}{3} \pi r^3 \text{ unit}^3 \\ &= \frac{4 \times 22 \times 3 \times 3 \times 3}{3 \times 7} \\ &= 113.1 \text{ cm}^3 \end{aligned}$$

$$\begin{aligned} \text{Total Surface Area} &= 4\pi r^2 \text{ unit}^2 \\ &= 4 \times \frac{22}{7} \times 3 \times 3 \\ &= \mathbf{113.1 \text{ cm}^2} \end{aligned}$$

- 2 Find the diameter of sphere having volume of 15625 cc.

$$\begin{aligned} \frac{4}{3} \pi r^3 &= \text{Volume} \\ \frac{4}{3} \times \frac{22}{7} \times r^3 &= 15625 \\ r^3 &= \frac{15625 \times 3 \times 7}{4 \times 22} \end{aligned}$$

$$= \frac{328125}{88}$$

$$= 3728.69$$

$$r = \sqrt[3]{3728.69}$$

$$= 15.51 \text{ cm}$$

$$\text{diameter} = 2 \times \text{radius}$$

$$= 2 \times 15.51$$

$$= 31.02 \text{ cm}$$

- 3 How many spherical balls of 1 cm radius can be made from a sphere of 32 cm diameter.

No. of balls x volume of small sphere = Volume of bigger sphere

$$N \times \frac{4}{3} \pi r^3 = \frac{4}{3} \pi R^3$$

$$N \times \frac{4}{3} \pi \times 1^3 = \frac{4}{3} \pi \times R^3$$

$$N = 16 \times 16 \times 16$$

$$= 4096 \text{ balls}$$

- 4 Three brass balls of diameters 3 cm, 4 cm and 5 cm are melted and make into one solid ball, if there is no wastage. Find the diameter of the solid ball.

$$1^{\text{st}} \text{ ball } d_1 = 3 \text{ cm,}$$

$$r_1 = 1.5 \text{ cm}$$

$$2^{\text{nd}} \text{ ball } d_2 = 4 \text{ cm,}$$

$$r_2 = 2 \text{ cm}$$

$$3^{\text{rd}} \text{ ball } d_3 = 5 \text{ cm,}$$

$$r_3 = 2.5 \text{ cm}$$

$$\text{Diameter of new ball} = ?$$

Volume of new ball = Volume of 3 spherical balls

$$\frac{4}{3} \pi r^3 = \frac{4}{3} \pi r_1^3 + \frac{4}{3} \pi r_2^3 + \frac{4}{3} \pi r_3^3$$

$$\frac{4}{3} \pi r^3 = \frac{4}{3} \pi (1.5^3 + 2^3 + 2.5^3)$$

$$r^3 = 3.375 + 8 + 15.625$$

$$r^3 = 27$$

$$r = \sqrt[3]{27}$$

$$r = \sqrt[3]{3 \times 3 \times 3}$$

$$r = 3 \text{ cm}$$

$$\text{Diameter of the ball} = 2 \times r$$

$$= 2 \times 3$$

$$= 6 \text{ cm}$$

Assignment

Cube

- Find the diagonal, lateral surface area, total surface area and volume of cube, whose side is 15 cm.
- Find the volume of 10 cubes where each side is 5 cm.
- Find its volume if a solid cube has each of its sides 60 mm long.
- What is its side if the total surface area of a cube is 384 m².

Cuboid

- Find the volume of the tank in m³, if the length is 60 m, breadth 40 m and height 20 m.
- Find the volume of a C.I. casting of a rectangular block having 25 cm x 20 cm x 8 cm size.
- Calculate the total surface area of a box whose length, width and height are 120 cm, 50 cm and 60 cm respectively.
- Find the volume of the sheet if a brass sheet is of 25 cm square and 0.4 cm thick.

Cylinder

- Find the curved surface area of cylinder whose diameter is 18 cm and height 34 cm?
- Find the total surface area of cylinder whose diameter is 24 cm and height 40 cm?
- Find out the volume of cylinder whose base is 10 cm radius and height is 40 cm?

Sphere

- Find the volume of sphere having diameter 3.5cm?
- Find the total surface area of a sphere having radius 1.75 cm?
- How many spherical balls of 1 cm radius can be made from a sphere of 16 cm diameter.
- Three balls of diameter 2m, 4cm and 6 cm are melted and made into one solid ball. If there is no wastage, find the diameter of solid ball.
